**ABSTRACT**

12257

This report presents a development of the Lagrangian equations of motion and a FORTRAN computer program for the motion of two rigid bodies in space, separating as a result of any one, or a combination of, the following force mechanisms: springs with ball ends, springs with one end guided, pyrotechnics, rockets, cold-gas jets, air pistons, and coulomb drag. Two constraints, treated by the method of Lagrange multipliers, are included as options. These constraints are the *pin-puller delay* and the *hard-mounted spring constraint*. The pin-puller delay represents the situation when one discrete separation device (e.g., a pin puller) actuates later than the others, providing a ball and socket type of joint prior to final separation-device firing. The hard-mounted spring constraint takes into account the fact that sliding, at the tip of a guided spring, is usually prohibited either by design or by inherent friction. The forces arising from the various mechanisms are represented by the customary mathematical models. No approximations are used in the derivation of the classical equations of motion; they are numerically integrated by the Adams-Moulton method.

*Author***I. INTRODUCTION**

The separation of two bodies in space is distinguished from the many other current applications of dynamics to space technology because it is associated with every space mission. Thus, the problem is of unique, practical

importance, and the need for an analytical tool to solve this dynamic problem is clear. The purpose of the work presented in this report has been to develop such a tool that is appropriate to a variety of separation schemes.

The basic approach to the problem is a straightforward application of the Lagrange equations augmented by undetermined multipliers. The mathematical complexity of the resultant equations is primarily due to the large number of degrees of freedom (12) and the coordinate transformations involved. Many of the more complex and tedious derivations have been relegated to the Appendixes.

The computer program, which consists of three chain links, is written in the FORTRAN/FAP system, and is compatible with the JPL/IBM 7094 installation.

The *input link* reads the input data and performs initial conversions. The locations and directions of all force-

producing devices are converted to the appropriate body-fixed coordinate system (CS), and initial conditions for the coordinates are generated.

The *integration link* applies the JPL integration subroutine FMARK to the differential equations. Separate subroutines for each force type compute the contributions to the generalized forces. Small matrix operation subroutines are used throughout this link.

The *plotting link* accepts the data to be plotted, generates scale factors, and prepares the other necessary plotting instructions.

## II. DESCRIPTION OF THE PHYSICAL PROBLEM AND THE CORRESPONDING MATHEMATICAL MODEL

### A. Physical Problem

All space exploration missions require, at some point in their lifetime, a separation of two bodies. The separation of an aerodynamic shroud from a launch vehicle, the separation of a spacecraft from a launch vehicle, and the separation of an exploratory module from its parent spacecraft are a few of the more common requirements.

In connection with the common types of separations that will be encountered, the following force-producing devices are considered to be significant: rockets, pyrotechnics, cold-gas jets, pneumatic pistons, coulomb drag, and springs.

Two constraint conditions are considered to be important aspects of the physical problem: (1) there is a dispersion among latching device release times, and (2) guided spring tips will not slip on their bearing surfaces.

### B. Mathematical Model

The mathematical model assumes two rigid bodies subjected to the action of forces from the following types of idealized devices:

1. Linear springs hard mounted on one body and bearing on the other (either with frictionless slippage or no slippage)

2. Linear springs between the two bodies with universal joints at both ends
3. Pyrotechnic devices supplying impulsive forces
4. Cold-gas jets—adiabatic processes of an ideal gas
5. Pneumatic pistons—adiabatic processes of an ideal gas
6. Coulomb drag between the bodies
7. Rockets (constant force), including linear changes in inertia properties

The primary assumptions concerning the forces are implicitly contained in the descriptions of these idealized devices. It has been assumed that the bodies do not have separation distances that are significant relative to the distance from the common center of mass (CM) to the center of any external force-field. The equations of motion are written in a reference frame that has fixed directions in inertial space, but that moves with the pre-separation trajectory of the two bodies; this frame is taken to be an inertial one. The results are then correct (when used in combination with a trajectory solution for the common CM) if there are no forces acting other than the ones considered in the analysis, or if there is an external force-field exerting approximately the same vector force per unit mass on each element of the system.

### III. SYMBOLS AND CONVENTIONS

#### A. Symbols

To make the analysis more useful for reference when writing input for the computer program, a descriptive listing is made at the beginning of each section detailing the notation for that particular section.

For clarity, the symbols that are used repeatedly throughout the text are listed below.

#### 1. Scalars

$a_{ij}$	element of the $\mathbf{A}_I$ matrix ( $i^{th}$ row, $j^{th}$ column)
$b_{ij}$	element of the $\mathbf{A}_{II}$ matrix
$c_{ij}$	generalized element of either $\mathbf{A}_I$ or $\mathbf{A}_{II}$
$k$	spring rate
$m$	mass
$\mathcal{Q}$	generalized force
$q$	generalized coordinate
$T$	kinetic energy
$\mathbf{T}$	matrix product $\mathbf{A}_I \mathbf{A}_{II}^{-1}$
$t$	time
$\Delta t$	length of integration interval
$x, y, z$	inertial coordinates of the CM
$x', y', z'$	body-fixed coordinates
$x'', y'', z''$	drawing board coordinates
$\theta, \phi, \psi$	Euler angles (see Appendix A)
$\lambda_x, \lambda_y, \lambda_z$	direction cosines with body I-fixed coordinate axes
$\mu_x, \mu_y, \mu_z$	direction cosines with drawing board axes when referring to body I
$\mu'_x, \mu'_y, \mu'_z$	direction cosines with drawing board axes when referring to body II
$\rho_x, \rho_y, \rho_z$	direction cosines with body II-fixed coordinate axes
$\omega_x'', \omega_y'', \omega_z''$	components of the initial angular velocity of body II in the drawing board CS
$\omega_{Ix'}, \omega_{Iy'}, \omega_{Iz'}$	components of the initial angular velocity of body I about the body I-fixed CS

$\omega_{IIx'}, \omega_{Ily'}, \omega_{Iiz'}$  components of the initial angular velocity of body II about the body II-fixed CS

#### 2. Vectors and Matrixes

$\mathbf{A}_I$	( $3 \times 3$ ) orthogonal transformation matrix that takes vectors in the inertial CS into vectors in the body I-fixed CS (see Appendix A)
$\mathbf{A}_{II}$	( $3 \times 3$ ) orthogonal transformation matrix that takes vectors in the inertial CS into vectors in the body II-fixed CS (see Appendix A)
$\mathbf{e}$	unit vector or column matrix in direction indicated by subscript
$\mathbf{I}$	inertia matrix
$\mathbf{r}$	$\mathbf{r}_{II} - \mathbf{r}_I$
$\mathbf{r}'_i$	location vector of $i^{th}$ device in the body I-fixed CS
$\mathbf{r}'_{ii}$	location vector of $i^{th}$ device in the body II-fixed CS
$\mathbf{r}_I$	$\begin{bmatrix} x_I \\ y_I \\ z_I \end{bmatrix}$
$\mathbf{r}_{II}$	$\begin{bmatrix} x_{II} \\ y_{II} \\ z_{II} \end{bmatrix}$
$\mathbf{v}$	velocity vector or column matrix
$\boldsymbol{\rho}$	$\begin{bmatrix} \rho_x \\ \rho_y \\ \rho_z \end{bmatrix}$
$\boldsymbol{\lambda}$	$\begin{bmatrix} \lambda_x \\ \lambda_y \\ \lambda_z \end{bmatrix}$
$\boldsymbol{\omega}$	angular velocity vector or column matrix

#### 3. Subscripts

$i, j, r, s$	nonspecific indexes
$k, l$	specific indexes
$I$	refers to body I
$II$	refers to body II
$0$	initial value

**B. Notation Conventions****1. Vector-Matrix**

In the interests of economy and clarity, the same notation is used for vectors and their associated  $(3 \times 1)$  column matrixes. The symbolism  $\mathbf{v}$  is used where it is to be considered a vector, as in  $(\mathbf{v} \times \boldsymbol{\omega})$  or  $(\mathbf{f} \cdot \mathbf{r})$ , and where it is to be considered a column matrix, as in  $\mathbf{v}^T \mathbf{I} \mathbf{v}$ .

**2. Trigonometric Function**

Since the sine and cosine functions of the Euler angles occur quite frequently throughout the text,  $\cos \theta$  is replaced by  $(c\theta)$  and  $\sin \theta$  is replaced by  $(s\theta)$ . The other Euler angles are treated similarly. Such expressions, or groups of expressions, are always enclosed in parentheses [e.g.,  $(-c\theta s\phi s\psi + c\phi c\psi)]$ .

**3. Miscellaneous**

The miscellaneous notation conventions used in this report are as follows:

**Bold face lower case letters**      vector,  $(3 \times 1)$  matrix

Bold face capital letters	square matrix
$\mathbf{a}_{(i)}$	$(3 \times 1)$ matrix formed from $i^{th}$ row of corresponding $(3 \times 3)$ matrix
$\mathbf{a}^{(i)}$	$(3 \times 1)$ matrix formed from $i^{th}$ column of corresponding $(3 \times 3)$ matrix
Dot ( $\cdot$ ) between vectors	scalar product (e.g., $\mathbf{f} \cdot \mathbf{r}$ )
Multiplication sign ( $\times$ ) between vectors	cross product (e.g., $\mathbf{f} \times \mathbf{r}$ )
Dot ( $\cdot$ ) over symbol	derivative with respect to time
Two dots ( $\cdot\cdot$ ) over symbol	second derivative with respect to time
$(\ )^T$	transpose
$(\ )^{-1}$	inverse
$ \mathbf{v} $	magnitude of $\mathbf{v}$
$\delta$	variational operator
$\delta_{ij}$	Kronecker delta

**IV. COORDINATE SYSTEMS**

The four coordinate systems used in this analysis are: (1) drawing board CS, (2) inertial CS, (3) body I-fixed CS, and (4) body II-fixed CS.

**A. Symbols**

$c$  (subscript) refers to common CM of bodies I and II

$\mathbf{r}$  location vector

$\epsilon$  location vector of CM indicated by subscript

$\lambda_{ix}, \lambda_{iy}, \lambda_{iz}$  cosines of angles between rocket directions, spring directions, etc., and drawing board axes when applicable to body I

$\mu_{ix}, \mu_{iy}, \mu_{iz}$  cosines of angles between rocket directions, spring directions, etc., and drawing board axes when applicable to body II

$\mu'_{ix}, \mu'_{iy}, \mu'_{iz}$  cosines of angles between rocket directions, spring directions, etc., and body I-fixed axes

$\rho_{ix}, \rho_{iy}, \rho_{iz}$  cosines of angles between rocket directions, spring directions, etc., and body II-fixed axes

$\omega$  angular velocity about axis indicated by subscript

**B. Generalized Coordinates**

To apply the Lagrange equations, it is necessary to choose a set of generalized coordinates. By definition, the generalized coordinates must be independent and must fully describe the position and orientation of the system. This analysis employs the three inertial coordinates of each CM and the three Euler angles for each

body (coordinates are defined in Subsection D). These coordinates form an independent and fully descriptive set unless certain special values of either  $\theta$ -coordinate are reached. The methods used to circumvent this difficulty are described in Subsections F and G.

### C. Drawing Board Coordinates

The 3-dimensional orthogonal drawing board coordinate system may be selected by the user, subject to the following restrictions:

1. If the hard-mounted spring constraint is to be present, the  $z''$  axis must be perpendicular to the separation plane (this situation is assumed in Appendix B, Eq. B-1).
2. Since the solutions for  $\theta$ ,  $\phi$ ,  $\psi$ , pitch and yaw rates, etc., depend on the definition of the body-fixed CS, which is in turn controlled by the definition of the drawing board CS, it will usually be convenient to make the drawing board CS parallel to any symmetry or geometric axes that the bodies may have.

### D. Inertial Coordinates

The point at which the common CM would be located if there were no separation is used as the origin of the inertial CS. The directions of these axes are taken to be fixed in the inertial CS attached to the fixed stars. The inertial CS is initially parallel to the drawing board CS. Because of its motion in the gravitational fields of the Sun, the planets, the galaxy, etc, this CS is not a true inertial system; however, as long as the bodies are sufficiently close to the origin to be in essentially the same gravitational field, they will move as though this CS is exactly an inertial system. The results of this analysis are then deviations from the pre-separation trajectory. To provide initial conditions for new trajectory calculations, it is recommended that the translation results be considered in conjunction with the initial trajectory.

Since the orientation and location of the two rigid bodies relative to the stars and planets is not considered, certain force effects must necessarily be neglected. For example, solar pressure effects are not included in the analysis. The pre-separation trajectory, however, includes the translational effects of solar pressure, based on the orientation relative to the Sun before separation (solar pressure is a function of paint patterns, etc., so that it is usually a function of orientation). Then, in translation, it is only the deviation from pre-separation solar pressure effects that is neglected. Solar pressure torques are neglected completely.

### E. CM Body-Fixed Coordinates and Eulerian Angles

A body-fixed CS is associated with each body. The respective CM's are the origins of these systems, and they are the references used for locating force-producing devices.

The orientation of each system is specified by a set of Eulerian angles that are generated in the following manner (Fig. 1):

1. Roll through angle  $\phi$
2. Pitch through an angle  $\theta$
3. Roll through an angle  $\psi$

A more complete description of the Eulerian angles is given in Appendix A.

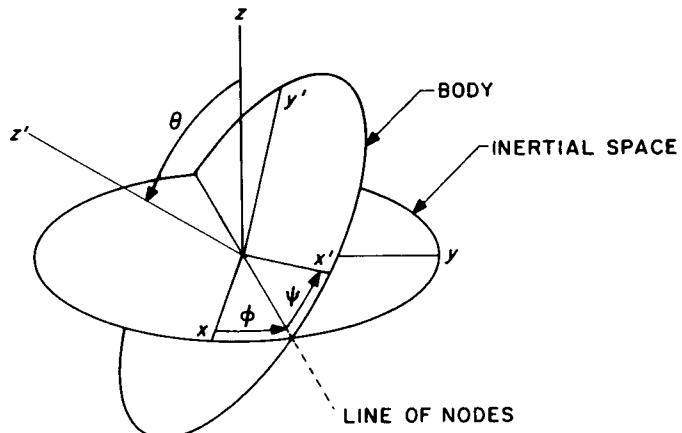

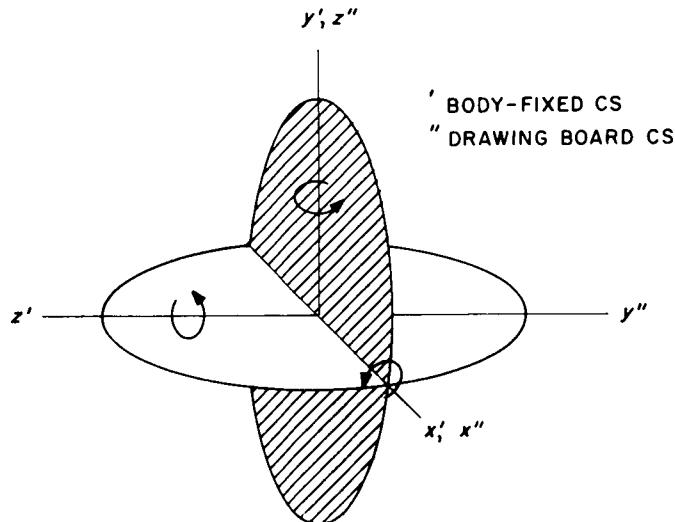

Fig. 1. Eulerian angles

### F. Coordinate Conversions From Drawing Board CS to Body-Fixed CS

Although it would be convenient to have the body-fixed CS initially parallel to the drawing board or inertial CS, it is not feasible. In both Section VI and Appendix C,  $\sin \theta$  appears in some denominators; this corresponds to dependence among the coordinates when either  $\sin \theta_1$  or  $\sin \theta_{11}$  vanishes. To avoid this, the body-fixed CS are defined so that ordinary initial conditions do not have either  $\theta$  equal to zero. Also, provision must be made to rotate (redefine) the body-fixed CS relative to the body if  $\sin \theta$  approaches zero.

The CM body-fixed CS (Fig. 2) is defined so that the initial value of  $\theta$  is 90 deg. The conversions between

**Fig. 2. Relation between drawing board coordinates and body-fixed coordinates**

drawing board coordinates and body-fixed coordinates are given in Eqs. (1) through (3).

$$\begin{aligned} x'_{ii} &= x''_i - \varepsilon''_{Ix} \\ x''_{ii} &= x''_i - \varepsilon''_{Iix} \end{aligned} \quad (1)$$

$$\begin{aligned} y'_{ii} &= z''_i - \varepsilon''_{Iz} \\ y''_{ii} &= z''_i - \varepsilon''_{IIz} \end{aligned} \quad (2)$$

$$\begin{aligned} z'_{ii} &= -(y''_i - \varepsilon''_{Iy}) \\ z''_{ii} &= -(y''_i - \varepsilon''_{Ily}) \end{aligned} \quad (3)$$

In addition to coordinate conversions, there are also direction cosine and inertia matrix conversions that must be made (Eqs. 4 through 12).

$$\begin{aligned} \lambda_{ix} &= \mu_{ix} \\ \rho_{ix} &= \mu'_{ix} \end{aligned} \quad (4)$$

$$\begin{aligned} \lambda_{iy} &= \mu_{iz} \\ \rho_{iy} &= \mu'_{iz} \end{aligned} \quad (5)$$

$$\begin{aligned} \lambda_{iz} &= -\mu_{iy} \\ \rho_{iz} &= -\mu'_{iy} \end{aligned} \quad (6)$$

$$I_{x'x'} = I_{x''x''} \quad (7)$$

$$I_{x'y'} = I_{x''y''} \quad (8)$$

$$I_{x'z'} = I_{x''z''} \quad (9)$$

$$I_{y'y'} = I_{z''z''} \quad (10)$$

$$I_{y'z'} = -I_{y''z''} \quad (11)$$

$$I_{z'z'} = I_{y''y''} \quad (12)$$

For simplicity in notation, the primes on the subscripts of the I's are dropped for the remainder of this analysis.

### G. Body-Fixed CS Redefinition

If  $\theta \leq 0.1$  and  $\dot{\theta} < 0$ , or if  $\theta \geq 3.04$  and  $\dot{\theta} > 0$ , all body-fixed coordinates, direction cosines, and inertia matrix elements relating to the body concerned are converted according to Eqs. (13) through (24); this is sufficient to assure that  $\sin \theta$  will not approach zero.

$$x'_{i\text{ new}} = x'_{i\text{ old}} \quad (13)$$

$$y'_{i\text{ new}} = z'_{i\text{ old}} \quad (14)$$

$$z'_{i\text{ new}} = -y'_{i\text{ old}} \quad (15)$$

$$\begin{aligned} \lambda_{ix\text{ new}} &= \lambda_{ix\text{ old}} \\ \rho_{ix\text{ new}} &= \rho_{ix\text{ old}} \end{aligned} \quad (16)$$

$$\begin{aligned} \lambda_{iy\text{ new}} &= \lambda_{iy\text{ old}} \\ \rho_{iy\text{ new}} &= \rho_{iy\text{ old}} \end{aligned} \quad (17)$$

$$\begin{aligned} \lambda_{iz\text{ new}} &= -\lambda_{iy\text{ old}} \\ \rho_{iz\text{ new}} &= -\rho_{iy\text{ old}} \end{aligned} \quad (18)$$

$$I_{xx\text{ new}} = I_{xx\text{ old}} \quad (19)$$

$$I_{xy\text{ new}} = I_{xz\text{ old}} \quad (20)$$

$$I_{xz\text{ new}} = -I_{xy\text{ old}} \quad (21)$$

$$I_{yy\text{ new}} = I_{zz\text{ old}} \quad (22)$$

$$I_{yz\text{ new}} = -I_{yz\text{ old}} \quad (23)$$

$$I_{zz\text{ new}} = I_{yy\text{ old}} \quad (24)$$

The foregoing redefinition is accomplished by rotating the body-fixed CS about the  $x'$  axis until  $y'_{\text{new}}$  coincides with  $z'_{\text{old}}$ , and  $z'_{\text{new}}$  coincides with  $-y'_{\text{old}}$ . Since the Eulerian angles are defined relative to the inertial CS, they now assume new values (see Fig. 3).

Straightforward application of the spherical trigonometric laws of cosines and sines to the spherical triangle containing the old and new Eulerian angles (Fig. 4) gives Eqs. (25) through (27).

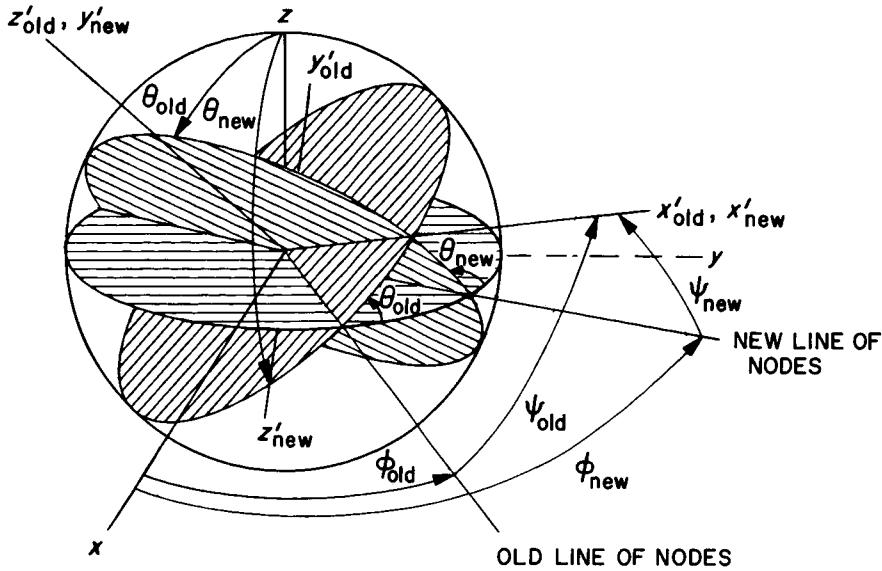

Fig. 3. Eulerian angle change due to CS redefinition

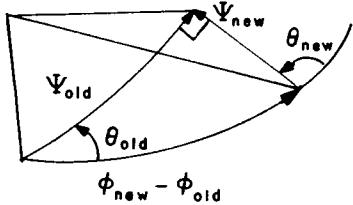

Fig. 4. Spherical triangles containing new and old Eulerian angles

$$\cos \theta_{\text{new}} = -\sin \theta_{\text{old}} \cos \psi_{\text{old}} \quad (25)$$

$$\sin(\phi_{\text{new}} - \phi_{\text{old}}) = \frac{\sin \psi_{\text{old}}}{(1 - \sin^2 \theta_{\text{old}} \cos^2 \psi_{\text{old}})^{1/2}} \quad (26)$$

$$\sin \psi_{\text{new}} = \frac{\sin \psi_{\text{old}} \sin \theta_{\text{old}}}{(1 - \sin^2 \theta_{\text{old}} \cos^2 \psi_{\text{old}})^{1/2}} \quad (27)$$

Since the computer does not have subroutines for the arc sine or arc cosine, it is necessary to restate the new Eulerian angles in terms of arc tangents (Eqs. 28 through 30).

$$\theta_{\text{new}} = \tan^{-1} \frac{(1 - \sin^2 \theta_{\text{old}} \cos^2 \psi_{\text{old}})^{1/2}}{\sin \theta_{\text{old}} \cos \psi_{\text{old}}} \quad (28)$$

$$\phi_{\text{new}} = \phi_{\text{old}} + \tan^{-1} \frac{\tan \psi_{\text{old}}}{\cos \theta_{\text{old}}} \quad (29)$$

$$\psi_{\text{new}} = \tan^{-1} (\tan \theta_{\text{old}} \sin \psi_{\text{old}}) \quad (30)$$

The quadrant of  $\theta_{\text{new}}$  may be obtained from Eq. (25). For the three ranges of  $\cos \psi_{\text{old}}$ ,  $\theta_{\text{new}}$  has a value within the indicated range:

$$\cos \psi_{\text{old}} < 0, \quad 0 < \theta_{\text{new}} < \frac{\pi}{2}$$

$$\cos \psi_{\text{old}} = 0, \quad \theta_{\text{new}} = \frac{\pi}{2}$$

$$\cos \psi_{\text{old}} > 0, \quad \frac{\pi}{2} < \theta_{\text{new}} < \pi$$

The quadrant of  $\phi_{\text{new}} - \phi_{\text{old}}$  may be obtained from Eq. (29) and Fig. 3. For the two ranges of  $\cos \theta_{\text{old}}$ , the quadrant of  $\phi_{\text{new}} - \phi_{\text{old}}$  is as follows:

$\cos \theta_{\text{old}} > 0$ ,  $\phi_{\text{new}} - \phi_{\text{old}}$  is in the same quadrant as  $\psi_{\text{old}}$

$\cos \theta_{\text{old}} < 0$ ,  $\phi_{\text{new}} - \phi_{\text{old}}$  is in the same quadrant as  $2\pi - \psi_{\text{old}}$

The quadrant of  $\psi_{\text{new}}$  may be obtained from Eq. (27) and Fig. 3. For the two ranges of  $\sin \psi_{\text{old}}$ , the quadrant of  $\psi_{\text{new}}$  is as follows:

$\sin \psi_{\text{old}} \geq 0$ ,  $\psi_{\text{new}}$  is in the same quadrant as  $\theta_{\text{old}}$

$\sin \psi_{\text{old}} < 0$ ,  $\psi_{\text{new}}$  is in the same quadrant as  $2\pi - \theta_{\text{old}}$

These redefinitions are carried out such that the angles have the ranges of  $0 < \theta < \pi$ ,  $0 \leq \phi < 2\pi$ , and  $0 \leq \psi < 2\pi$ .

### H. Initial Values

If the locations of the CM's of bodies I and II are  $\epsilon''_I$  and  $\epsilon''_{II}$  in the drawing board CS, then

$$\epsilon''_{cx} = \frac{m_I \epsilon''_{Ix} + m_{II} \epsilon''_{IIX}}{m_I + m_{II}} \quad (31)$$

$$\epsilon''_{cy} = \frac{m_I \epsilon''_{Iy} + m_{II} \epsilon''_{IHy}}{m_I + m_{II}} \quad (32)$$

$$\epsilon''_{cz} = \frac{m_I \epsilon''_{Iz} + m_{II} \epsilon''_{IHx}}{m_I + m_{II}} \quad (33)$$

and the initial values of the generalized coordinates are given in Eqs. (34) through (37).

$$\begin{aligned} x_{I0} &= \epsilon''_{Ix} - \epsilon''_{cx} \\ x_{II0} &= \epsilon''_{IIX} - \epsilon''_{cx} \end{aligned} \quad (34)$$

$$\begin{aligned} y_{I0} &= \epsilon''_{Iy} - \epsilon''_{cy} \\ y_{II0} &= \epsilon''_{IHy} - \epsilon''_{cy} \end{aligned} \quad (35)$$

$$\begin{aligned} z_{I0} &= \epsilon''_{Iz} - \epsilon''_{cz} \\ z_{II0} &= \epsilon''_{IHx} - \epsilon''_{cz} \end{aligned} \quad (36)$$

$$\theta_{I0} = \theta_{II0} = \frac{\pi}{2}, \quad \phi_{I0} = \phi_{II0} = 0 \quad (37)$$

$$\psi_{I0} = \psi_{II0} = 0$$

The initial values of the components of the translational velocities are

$$\dot{x}_{I0} = \omega_{Iy'} z_{I0} - \omega_{Iz'} y_{I0}$$

$$\dot{y}_{I0} = \omega_{Ix'} x_{I0} - \omega_{Iz'} z_{I0}$$

$$\dot{z}_{I0} = \omega_{Ix'} y_{I0} - \omega_{Iy'} z_{I0}$$

and

$$\dot{x}_{II0} = \omega_{IIy'} z_{II0} - \omega_{IIz'} y_{II0}$$

$$\dot{y}_{II0} = \omega_{IIx'} x_{II0} - \omega_{IIz'} z_{II0}$$

$$\dot{z}_{II0} = \omega_{IIx'} y_{II0} - \omega_{IIy'} z_{II0} \quad (38)$$

The components of the initial angular velocities are determined in Appendix C, Eqs. (C-10) through (C-12). Note that initially

$$\omega_{Ix'} = \omega_{IIx'} = \omega_x'' \quad (39)$$

$$\omega_{Iy'} = \omega_{Iy'0} + \omega_z'' \quad (40)$$

$$\omega_{IIy'} = \omega_z''$$

$$\omega_{Iz'} = \omega_{IIz'} = -\omega_y'' \quad (41)$$

Where  $\omega_x'', \omega_y'', \omega_z''$  are the initial angular velocities of body II in the drawing board CS; the bodies are assumed to be connected at  $t = 0$ , but a relative roll rate about  $z''$ , namely  $\omega_{IIy'0}$ , is permitted.

## V. SOLUTION TECHNIQUE

Because of the ease with which the constraint conditions can be included in the Lagrangian formulation, this method was chosen for the derivation of the equations of motion.

### A. Symbols

$f_i$  force due to  $i^{th}$  device

$\mathcal{Q}$  generalized force

$q$  generalized coordinate

$T$  kinetic energy

$t$  time

$\lambda_l$  Lagrange multipliers

### B. Lagrange Equations

The Lagrange equations, in the form most useful for this problem, are given by

$$\frac{d}{dt} \left( \frac{\partial T}{\partial \dot{q}_s} \right) - \frac{\partial T}{\partial q_s} = \mathcal{Q}_s \quad (42)$$

The generalized forces for the chosen coordinates are given by Eqs. (43) through (48) (see Appendix D).

$$\mathcal{Q}_x = \sum f_i \cdot e_{ix} \quad (43)$$

$$\mathcal{Q}_y = \sum f_i \cdot e_{iy} \quad (44)$$

$$\mathcal{Q}_z = \sum f_i \cdot e_{iz} \quad (45)$$

$$\mathcal{Q}_\theta = \Sigma (\text{all torques about } \theta \text{ axis}) \quad (46)$$

$$\mathcal{Q}_\phi = \Sigma (\text{all torques about } \phi \text{ axis}) \quad (47)$$

$$\mathcal{Q}_\psi = \Sigma (\text{all torques about } \psi \text{ axis}) \quad (48)$$

The  $\theta$  axis is defined as a line passing through the CM perpendicular to the plane in which  $\theta$  is measured; the  $\phi$  axis and the  $\psi$  axis are defined similarly.

### C. Constraints

Since the coordinates are no longer independent when constraints are present, Eq. (42) cannot be directly applied.

There are several methods of incorporating constraints; the method used here is the Lagrange multiplier technique. This technique uses nearly all of the mathematical machinery available in the unconstrained case, and is readily adaptable to numerical solution.

It can be shown<sup>1</sup> that if the constraints can be put in the form

$$\sum_s e_{ls} dq_s + e_{lt} dt = 0 \quad (49)$$

where  $l$  is used to indicate the different constraint equations, the equations of motion may be written in the form

$$\frac{d}{dt} \left( \frac{\partial T}{\partial \dot{q}_s} \right) - \frac{\partial T}{\partial q_s} = \mathcal{Q}_s + \sum_l \lambda_l e_{ls}$$

$$s = 1, 2, \dots, 12 \quad (50)$$

together with

$$\sum_s e_{ls} \dot{q}_s + e_{lt} = 0$$

$$l = 1, 2, \dots, l_m, \quad l_m = \text{number of constraints} \quad (51)$$

where  $\lambda_l$  are the undetermined Lagrange multipliers. These make  $12 + l_m$  equations in the  $12 + l_m$  unknowns

$$[q_s (s = 1, \dots, 12), \quad \text{and} \quad \lambda_l (l = 1, \dots, l_m)]$$

that must be solved.

Although more equations must now be solved, most of the terms are calculated in the same manner as when no constraints are acting.

<sup>1</sup>Goldstein, H., *Classical Mechanics*, Addison-Wesley Publishing Company, Inc., Reading, Massachusetts, 1959, pp. 40-43.

Since the constraints to be dealt with are both scleronomous and holonomic, they are of the form

$$f_l (q_1, \dots, q_{12}) = 0 \quad (52)$$

from which we obtain

$$\sum_s \frac{\partial f_l}{\partial q_s} dq_s = 0, \quad \sum_s \frac{\partial f_l}{\partial q_s} \dot{q}_s = 0 \quad (53)$$

and

$$e_{ls} = \frac{\partial f_l}{\partial q_s}, \quad e_{lt} = 0 \quad (54)$$

To make the constraint Eqs. (51) compatible (for numerical solution) with the Lagrange equations, they must be differentiated once more, with respect to time, giving

$$\sum_s (\dot{e}_{ls} \dot{q}_s + e_{ls} \ddot{q}_s) = 0 \quad (55)$$

or

$$\sum_s e_{ls} \ddot{q}_s = r_l \quad (56)$$

where

$$r_l = - \sum_s \dot{e}_{ls} \dot{q}_s \quad (57)$$

Equations (50) and (56) are then the complete set for the  $12 + l_m$  unknowns.

### D. Units

Since rocket thrusts, spring forces, etc., will normally be reported in pounds (force), and masses will normally be reported as earth-surface weights (pounds mass), and dimensional locations will normally be reported in inches, it will be convenient to employ the following system:

Quantity	Unit
Force	lbf
Mass	lbm
Time	sec
Length	in.

This is not a consistent system of units; that is, the equations of motion will not be dimensionally correct if the values reported in this system are entered directly into the equations. Dimensional consistency is obtained by multiplying the generalized forces by the constant  $k = 385.7 \text{ in./sec}^2$ .

## VI. FORCES

The forces must be expressed explicitly so that they may be entered into the equations of motion. The forces are divided into groups (depending on how they are produced) and are then added appropriately. For any particular problem, however, most of the forces will be absent. The program (Sections IX through XIII) has been written so that the sets of force calculations may be avoided to save computation time.

### A. Components of $\mathcal{Q}$

- $\mathcal{Q}$  generalized force
- $\mathcal{D}$  component of  $\mathcal{Q}$  due to coulomb drag forces
- $\mathcal{E}$  component of  $\mathcal{Q}$  due to explosive forces (pyrotechnics)
- $\mathcal{J}$  component of  $\mathcal{Q}$  due to cold-gas jet forces
- $\mathcal{M}$  component of  $\mathcal{Q}$  due to pneumatic forces
- $\mathcal{R}$  component of  $\mathcal{Q}$  due to hot rocket forces
- $\mathcal{S}$  component of  $\mathcal{Q}$  due to body II hard-mounted springs
- $\mathcal{W}$  component of  $\mathcal{Q}$  due to universally-jointed springs

The summation equation for the components of  $\mathcal{Q}$  is

$$\mathcal{Q}_s = \mathcal{D}_s + \mathcal{E}_s + \mathcal{J}_s + \mathcal{M}_s + \mathcal{R}_s + \mathcal{S}_s + \mathcal{W}_s \quad (58)$$

where

$$s = I_x, \dots, II_\psi$$

### B. Coulomb Drag

A coulomb drag force is assumed to act between two points, one on each body, which are initially coincident.

The drag force ceases when the separation distance exceeds some selected value. This model represents the usual idealization of electrical disconnects and similar devices. The forces are constant during their action time and take the direction of  $v_i$  (defined below).

### 1. Symbols

- $D_i$  estimated potential drag force at point  $i$
- $D_i$  magnitude of  $i^{th}$  drag force
- $d_i$  separation distance vector at point  $i$
- $d_i$  separation distance at point  $i$  (see Eqs. 59 and 60)
- $d_{if}$  separation distance beyond which  $i^{th}$  drag force ceases
- $v_i$  separation velocity at point  $i$  (see Appendix E)
- $e_\theta, e_\phi, e_\psi$  unit vectors in the  $\theta, \phi$ , and  $\psi$  directions

### 2. Distance $d_i$ , Between a Point on Body I and a Point on Body II

Clearly

$$\mathbf{d}_i = \mathbf{r}_{Ii} - \mathbf{r}_{IIi} = \mathbf{r} + \mathbf{A}_I^T \mathbf{r}'_{Ii} - \mathbf{A}_{II}^T \mathbf{r}'_{IIi} \quad (59)$$

where

$$\begin{aligned} \mathbf{d}_i &= \begin{bmatrix} d_{ix} \\ d_{iy} \\ d_{iz} \end{bmatrix}, & \mathbf{r}'_{Ii} &= \begin{bmatrix} x'_{Ii} \\ y'_{Ii} \\ z'_{Ii} \end{bmatrix} \\ \mathbf{r}'_{IIi} &= \begin{bmatrix} x'_{IIi} \\ y'_{IIi} \\ z'_{IIi} \end{bmatrix}, & \mathbf{r} &= \mathbf{r}_I - \mathbf{r}_{II} \end{aligned} \quad (60)$$

### 3. Generalized Forces

The generalized forces are given in Eqs. (61) through (66).

$$\mathcal{Q}_{Ix} = \sum_i \left( -D_i \frac{\mathbf{v}_{ix}}{|\mathbf{v}_i|} \right) = -\mathcal{D}_{IIx} \quad (61)$$

$$\mathcal{Q}_{Iy} = \sum_i \left( -D_i \frac{\mathbf{v}_{iy}}{|\mathbf{v}_i|} \right) = -\mathcal{D}_{IIy} \quad (62)$$

$$\mathcal{D}_{Iz} = \sum_i \left( -D_i \frac{\mathbf{v}_{iz}}{|\mathbf{v}_i|} \right) = -\mathcal{D}_{IIz} \quad (63)$$

$$\mathcal{D}_{I\theta} = \left\{ \sum_i \left( -\frac{D_i}{|\mathbf{v}_i|} \right) [(\mathbf{A}_I^T \mathbf{r}_{ii}) \times \mathbf{v}_i] \right\} \cdot \mathbf{e}_{I\theta} \quad (64)$$

$$\mathcal{D}_{I\phi} = \left\{ \sum_i \left( -\frac{D_i}{|\mathbf{v}_i|} \right) [(\mathbf{A}_I^T \mathbf{r}_{ii}) \times \mathbf{v}_i] \right\} \cdot \mathbf{e}_{I\phi} \quad (65)$$

$$\mathcal{D}_{I\psi} = \left\{ \sum_i \left( -\frac{D_i}{|\mathbf{v}_i|} \right) [(\mathbf{A}_I^T \mathbf{r}_{ii}) \times \mathbf{v}_i] \right\} \cdot \mathbf{e}_{I\psi} \quad (66)$$

$$\begin{aligned} D_i &= D_i && \text{if } d_i \leq d_{if} \\ D_i &= 0 && \text{if } d_i > d_{if} \end{aligned} \quad (67)$$

$\mathcal{D}_{II\theta}$ ,  $\mathcal{D}_{II\phi}$ , and  $\mathcal{D}_{II\psi}$  are found by replacing I by II and reversing sign in Eqs. (64), (65), and (66). The unit vectors are

$$\begin{aligned} \mathbf{e}_{I\theta} &= \begin{bmatrix} (\cos \theta_I) \\ (\sin \theta_I) \\ 0 \end{bmatrix}, & \mathbf{e}_{I\phi} &= \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}, & \mathbf{e}_{I\psi} &= \begin{bmatrix} (\sin \theta_I \cos \phi_I) \\ (-\sin \theta_I \sin \phi_I) \\ (\cos \theta_I) \end{bmatrix} \\ \mathbf{e}_{II\theta} &= \begin{bmatrix} (\cos \theta_{II}) \\ (\sin \theta_{II}) \\ 0 \end{bmatrix}, & \mathbf{e}_{II\phi} &= \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}, & \mathbf{e}_{II\psi} &= \begin{bmatrix} (\sin \theta_{II} \cos \phi_{II}) \\ (-\sin \theta_{II} \sin \phi_{II}) \\ (\cos \theta_{II}) \end{bmatrix} \end{aligned} \quad (68)$$

### C. Pyrotechnics

Forces due to pyrotechnic devices are considered to be impulsive in nature, and are taken to act between the two bodies, as in the case of bolt cutters, explosive bolts, and linear separation charges. The devices are assumed to have fixed locations and directions relative to body II.

#### 1. Symbols

- $E_i$  force due to  $i^{th}$  pyrotechnic device
- $I_i$  total impulse of  $i^{th}$  device
- $t_i$  firing time of  $i^{th}$  device
- $\Delta t$  integration interval
- $\mathbf{p}_i$  direction cosine vector of the  $i^{th}$  device in the body II CS.

#### 2. Forces

The impulses are idealized as constant forces acting over one integration interval. Thus

$$\begin{aligned} E_i &= 0 && \text{for } t < t_i - \frac{\Delta t}{2} \quad \text{or} \quad t > t_i + \frac{\Delta t}{2} \\ E_i &= \frac{I_i}{\Delta t} && \text{for } t_i - \frac{\Delta t}{2} \leq t \leq t_i + \frac{\Delta t}{2} \end{aligned} \quad (69)$$

The generalized forces are given in Eqs. (70) through (78).

$$\mathcal{E}_{Ix} = \sum_i E_i \mathbf{b}^{(1)T} \cdot \boldsymbol{\rho}_i \frac{(x_I - x_{II})}{|x_I - x_{II}|} = -\mathcal{E}_{IIX} \quad (70)$$

$$\mathcal{E}_{Iy} = \sum_i E_i \mathbf{b}^{(2)T} \cdot \boldsymbol{\rho}_i \frac{(x_I - x_{II})}{|x_I - x_{II}|} = -\mathcal{E}_{IIX} \quad (71)$$

$$\mathcal{E}_{Iz} = \sum_i E_i \mathbf{b}^{(3)T} \cdot \boldsymbol{\rho}_i \frac{(x_I - x_{II})}{|x_I - x_{II}|} = -\mathcal{E}_{IIX} \quad (72)$$

$$\mathcal{E}_{I\theta} = \left\{ \sum_i E_i [(\mathbf{A}_{II}^T \mathbf{r}'_{IIi} + \mathbf{r}) \times (\mathbf{A}_{II}^T \boldsymbol{\rho}_i)] \right\} \cdot \mathbf{e}_{I\theta} \quad (73)$$

$$\mathcal{E}_{I\phi} = \left\{ \sum_i E_i [(\mathbf{A}_{II}^T \mathbf{r}'_{IIi} + \mathbf{r}) \times (\mathbf{A}_{II}^T \boldsymbol{\rho}_i)] \right\} \cdot \mathbf{e}_{I\phi} \quad (74)$$

$$\mathcal{E}_{I\psi} = \left\{ \sum_i E_i [(\mathbf{A}_{II}^T \mathbf{r}'_{IIi} + \mathbf{r}) \times (\mathbf{A}_{II}^T \boldsymbol{\rho}_i)] \right\} \cdot \mathbf{e}_{I\psi} \quad (75)$$

$$\mathcal{E}_{II\theta} = \left\{ \mathbf{A}_{II}^T \left[ \sum_i E_i (\mathbf{r}'_{IIi} \times \boldsymbol{\rho}_i) \right] \right\} \cdot \mathbf{e}_{II\theta} \quad (76)$$

$$\mathcal{E}_{II\phi} = \left\{ \mathbf{A}_{II}^T \left[ \sum_i E_i (\mathbf{r}'_{IIi} \times \boldsymbol{\rho}_i) \right] \right\} \cdot \mathbf{e}_{II\phi} \quad (77)$$

$$\mathcal{E}_{II\psi} = \left\{ \mathbf{A}_{II}^T \left[ \sum_i E_i (\mathbf{r}'_{IIi} \times \boldsymbol{\rho}_i) \right] \right\} \cdot \mathbf{e}_{II\psi} \quad (78)$$

## D. Cold-Gas Jets

Cold-gas jet reaction systems are assumed to be of the constant volume, unregulated type. The *adiabatic process of an ideal gas approximation* is made in this section.

### 1. Symbols

$A_{ie}$	area at exit of nozzle jet $i$
$A_{ig}$	area at throat of nozzle jet $i$
$C_{i1}, C_{i2}, C_{i3}$	constants for jet $i$ depending on nozzle geometry and properties of working fluid
$f_{i1}, f_{i2}, f_3$	constants for jet $i$ depending on initial conditions, nozzle geometry, and properties of working fluid
$\mathbf{J}_i$	vector force of jet $i$
$J_i$	magnitude of the vector force of jet $i$
$J_{st}$	value of jet force below which $J_i$ may be considered zero
$M_{ie}$	mach number at exit of jet $i$
$p$	pressure
$p_{ito}$	initial pressure in bottle for jet $i$
$R$	gas constant for working fluid as in $pv = RT$
$T$	absolute temperature
$T_{ito}$	initial temperature in bottle for jet $i$
$t$	time

$t_{ie}$	time at which $i^{th}$ jet fires
$t_{if}$	time at which $i^{th}$ jet cuts off
$t_i$	$t - t_{ie}$
$V_{io}$	volume of bottle for jet $i$
$v$	specific volume
$\alpha_i$	$i^{th}$ nozzle divergence half angle
$\gamma$	ratio of specific heats, $c_p/c_v$ , for working fluid
$\lambda_i$	nozzle divergence factor for jet $i$
$\lambda_{ix}, \lambda_{iy}, \lambda_{iz}$	cosines of angles between thrust vector for jet $i$ and body I axes
$\rho_{ix}, \rho_{iy}, \rho_{iz}$	cosines of angles between thrust vector for jet $i$ and body II axes

It is assumed (in Appendix F) that the total mass expelled by the cold-gas jets is negligible compared to the total mass of the body.

## 2. Forces

The vector force is given in Eq. (79), where either

$$\mathbf{J}_i = J_i (\lambda_{ix} \mathbf{e}_{Ix'} + \lambda_{iy} \mathbf{e}_{Iy'} + \lambda_{iz} \mathbf{e}_{Iz'})$$

or

$$\mathbf{J}_i = J_i (\rho_{ix} \mathbf{e}_{IIx'} + \rho_{iy} \mathbf{e}_{Ily'} + \rho_{iz} \mathbf{e}_{Iiz'}) \quad (79)$$

This subsection contains all of the definitions necessary to use the force equations. Appendix F details the derivation of the following equations.

$$t_{ie} \leq t \leq t_{if}, \quad J_i = \frac{f_{i1}}{(1 + f_{i2} t_i)^{f_3}} \quad (80)$$

$$t < t_{ie} \quad \text{or} \quad t > t_{if} \quad \text{or} \quad J_i < J_{st}, \quad J_i = 0 \quad (81)$$

Where

$$f_{i1} = (-\lambda_i C_{i1} C_{i2} + A_{ie} C_{i3}) p_{ito} \quad (82)$$

$$f_{i2} = \left( \frac{\gamma - 1}{2} \right) \left( \frac{2}{\gamma + 1} \right)^{\gamma+1/[2(\gamma-1)]} (\gamma R T_{ito})^{1/2} \frac{A_{ig}}{V_{io}} \quad (83)$$

$$f_3 = \frac{2\gamma}{\gamma - 1} \quad (84)$$

And where

$$\lambda_i = \frac{1}{2} (1 + \cos \alpha_i) \quad (85)$$

$$C_{i1} = -A_{ig} \left( \frac{2}{\gamma + 1} \right)^{\gamma+1/[2(\gamma-1)]} \left( \frac{\gamma}{R} \right)^{1/2} \quad (86)$$

$$C_{i2} = \frac{M_{ie} (\gamma R)^{1/2}}{\left( 1 + \frac{\gamma - 1}{2} M_{ie}^2 \right)^{1/2}} \quad (87)$$

$$C_{i3} = \left( 1 + \frac{\gamma - 1}{2} M_{ie}^2 \right)^{-\gamma/(\gamma-1)} \quad (88)$$

$M_{ie}$  or the nozzle area ratio is to be determined from Eq. (89).

$$\frac{A_{ig}}{A_{ie}} = \left( \frac{\gamma + 1}{2} \right)^{\gamma+1/[2(\gamma-1)]} M_{ie} \left( 1 + \frac{\gamma - 1}{2} M_{ie}^2 \right)^{-\gamma+1/[2(\gamma-1)]} \quad (89)$$

The generalized forces are given in Eqs. (90) through (102).

$$\mathcal{J}_{Ix} = \mathbf{a}^{(1)T} \left[ \sum_i J_i \boldsymbol{\lambda}_i \right] \quad (90)$$

$$\mathcal{J}_{Iy} = \mathbf{a}^{(2)T} \left[ \sum_i J_i \boldsymbol{\lambda}_i \right] \quad (91)$$

$$\mathcal{J}_{Iz} = \mathbf{a}^{(3)T} \left[ \sum_i J_i \boldsymbol{\lambda}_i \right] \quad (92)$$

$$\mathcal{J}_{Io} = \left[ \sum_i J_i (\mathbf{r}'_{Ii} \times \boldsymbol{\lambda}_i) \right] \cdot \mathbf{e}'_{Io} \quad (93)$$

$$\mathcal{J}_{I\phi} = \left[ \sum_i J_i (\mathbf{r}'_{Ii} \times \boldsymbol{\lambda}_i) \right] \cdot \mathbf{e}'_{I\phi} \quad (94)$$

$$\mathcal{J}_{I\psi} = \left[ \sum_i J_i (\mathbf{r}'_{Ii} \times \boldsymbol{\lambda}_i) \right] \cdot \mathbf{e}'_{I\psi} \quad (95)$$

$$\mathcal{J}_{IIx} = \mathbf{b}^{(1)T} \left[ \sum_i J_i \boldsymbol{\rho}_i \right] \quad (96)$$

$$\mathcal{J}_{Iiy} = \mathbf{b}^{(2)T} \left[ \sum_i J_i \boldsymbol{\rho}_i \right] \quad (97)$$

$$\mathcal{J}_{IIz} = \mathbf{b}^{(3)T} \left[ \sum_i J_i \boldsymbol{\rho}_i \right] \quad (98)$$

$$\mathcal{J}_{IIo} = \left[ \sum_i J_i (\mathbf{r}'_{IIi} \times \boldsymbol{\rho}_i) \right] \cdot \mathbf{e}'_{IIo} \quad (99)$$

$$\mathcal{J}_{IIf} = \left[ \sum_i J_i (\mathbf{r}'_{IIi} \times \boldsymbol{\rho}_i) \right] \cdot \mathbf{e}'_{IIf} \quad (100)$$

$$\mathcal{J}_{IIf} = \left[ \sum_i J_i (\mathbf{r}'_{IIi} \times \boldsymbol{\rho}_i) \right] \cdot \mathbf{e}'_{IIf} \quad (101)$$

where

$$\begin{aligned} \mathbf{e}'_o &= \begin{bmatrix} (c\psi) \\ -(s\psi) \\ 0 \end{bmatrix} \\ \mathbf{e}'_\phi &= \mathbf{c}^{(3)} \\ \mathbf{e}'_\psi &= \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \end{aligned} \quad (102)$$

## E. Pneumatics

Pneumatic ejection systems are modeled as a number of piston-cylinder assemblies fixed in body II and connected to a central reservoir (with or without regulation). It is assumed that the gas process is adiabatic, and that the gas is ideal.

### 1. Symbols

A	area of piston face
J	regulator existence index: if 0, there is no regulator; if 1, there is a regulator that remains closed after $p_b = p_p$ ; if 2, there is a regulator that remains open after $p_b = p_p$
$j_i$	displacement of $i^{th}$ piston from closed position (see Appendix B)
$j_{eqp, i}$	value of $j_i$ such that $p_b = p_p$
$j_{max, i}$	distance at which $i^{th}$ piston separates
$N_i$	magnitude of the $i^{th}$ pneumatic force
$\mathbf{N}_i$	pneumatic force vector of the $i^{th}$ piston
$p$	pressure
$V_b$	volume of gas bottle, including all lines upstream of the faces of the closed pistons
$b$ (subscript)	gas bottle
$i$ (subscript)	refers to the $i^{th}$ piston assembly or a part of the assembly
$p$ (subscript)	piston chamber
0 (subscript)	initial conditions
$\gamma$	ratio of specific heats for working fluids
$\rho_{ix}, \rho_{iy}, \rho_{iz}$	cosines of angles between piston rod $i$ and the $x'_{II} y'_{II} z'_{II}$ axes

### 2. Forces

Using the results of Appendix H, the forces are calculated as shown in Eq. (103).

$$\mathbf{N}_i = N_i (\rho_{ix} \mathbf{e}_{IIx'} + \rho_{iy} \mathbf{e}_{Ily'} + \rho_{iz} \mathbf{e}_{IIz'}) \quad (103)$$

The factors that must be taken into consideration when calculating the value of  $N_i$  are: whether or not there is a pressure regulator and, if there is, whether or not it stays open after  $p_b = p_p$ .

$$j_{eqp, i} = \frac{V_b}{\gamma A_i} \left( \frac{p_{b0}}{p_{pi}} - 1 \right) \quad (104)$$

Where  $J = 0$ ,

if

$$j_i < j_{max, i}$$

then

$$N_i = p_{b0} A_i \left( 1 + \frac{\sum_i A_i j_i}{V_b} \right)^{-\gamma} \quad (105)$$

if

$$j_i \geq j_{max, i}$$

then

$$N_i = 0 \quad (106)$$

Where  $J = 1$ ,

if

$$j_i \leq j_{eqp,i}$$

then

$$N_i = p_{pi} A_i \quad (107)$$

if

$$j_{eqp,i} < j_i < j_{max,i}$$

then

$$N_i = p_{pi} A_i \left( \frac{j_{eqp,i}}{j_i} \right)^\gamma \quad (108)$$

if

$$j_{max,i} \leq j_i$$

then

$$N_i = 0 \quad (109)$$

Where  $J = 2$ ,

if

$$j_i \leq j_{eqp,i}$$

then

$$N_i = p_{pi} A_i \quad (110)$$

if

$$j_{eqp,i} < j_i < j_{max,i}$$

then

$$N_i = p_{pi} A_i \left( 1 + \frac{\sum_k A_k b_k}{V_b \sum_k A_k C_k} \right)^{-\gamma} \quad (111)$$

if

$$j_{max,i} \leq j_i$$

then

$$N_i = 0 \quad (112)$$

Where

$$b_k = j_k \quad \text{if} \quad j_k < j_{eqp,k} \quad (113)$$

$$b_k = j_k - j_{eqp,k} \quad \text{if} \quad j_{eqp,k} \leq j_k \quad (114)$$

and

$$C_k = j_k \quad \text{if} \quad j_k < j_{eqp,k} \quad (115)$$

$$C_k = j_{eqp,k} \quad \text{if} \quad j_{eqp,k} \leq j_k \quad (116)$$

The generalized forces are given in Eqs. (117) through (126).

$$\eta_{Ix} = \mathbf{b}^{(1)T} \cdot \left[ \sum_i N_i \mathbf{p}_i \right] \frac{\mathbf{x}_I - \mathbf{x}_{II}}{|\mathbf{x}_I - \mathbf{x}_{II}|} = -\eta_{IIx} \quad (117)$$

$$\eta_{Iy} = \mathbf{b}^{(2)T} \cdot \left[ \sum_i N_i \mathbf{p}_i \right] \frac{\mathbf{y}_I - \mathbf{y}_{II}}{|\mathbf{y}_I - \mathbf{y}_{II}|} = -\eta_{Ily} \quad (118)$$

$$\eta_{Iz} = \mathbf{b}^{(3)T} \cdot \left[ \sum_i N_i \mathbf{p}_i \right] \frac{\mathbf{z}_I - \mathbf{z}_{II}}{|\mathbf{z}_I - \mathbf{z}_{II}|} = -\eta_{IIz} \quad (119)$$

$$\eta_{I\theta} = \left[ \sum_i N_i (\mathbf{A}_I^T \mathbf{r}'_{Ii}) \times (\mathbf{A}_{II}^T \mathbf{p}_i) \right] \cdot \mathbf{e}_{I\theta} \quad (120)$$

$$\eta_{I\phi} = \left[ \sum_i N_i (\mathbf{A}_I^T \mathbf{r}'_{Ii}) \times (\mathbf{A}_{II}^T \mathbf{p}_i) \right] \cdot \mathbf{e}_{I\phi} \quad (121)$$

$$\eta_{I\psi} = \left[ \sum_i N_i (\mathbf{A}_I^T \mathbf{r}'_{Ii}) \times (\mathbf{A}_{II}^T \mathbf{p}_i) \right] \cdot \mathbf{e}_{I\psi} \quad (122)$$

$$\eta_{II\theta} = - \left[ \sum_i N_i (\mathbf{r}'_{IIi} \times \mathbf{p}_i) \right] \cdot \mathbf{e}'_{II\theta} \quad (123)$$

$$\eta_{II\phi} = - \left[ \sum_i N_i (\mathbf{r}'_{IIi} \times \mathbf{p}_i) \right] \cdot \mathbf{e}'_{II\phi} \quad (124)$$

$$\eta_{II\psi} = - \left[ \sum_i N_i (\mathbf{r}'_{IIi} \times \mathbf{p}_i) \right] \cdot \mathbf{e}'_{II\psi} \quad (125)$$

Where

$$\mathbf{e}_{I\theta} = \begin{bmatrix} (c\phi) \\ (s\phi) \\ 0 \end{bmatrix}, \quad \mathbf{e}_{I\phi} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}, \quad \mathbf{e}_{I\psi} = \mathbf{c}^{(3)} \quad (126)$$

The unit vectors with regard to the body II-fixed CS ( $\mathbf{e}'_{II\theta}$ ,  $\mathbf{e}'_{II\phi}$ ,  $\mathbf{e}'_{II\psi}$ ), are given in Eqs. (102).

## F. Rockets

Provision is made for attaching body-fixed, constant-force rockets to either body I or body II.

### 1. Symbols

$\dot{\mathbf{I}}_{xxII}, \dots, \dot{\mathbf{I}}_{zzII}$  moment of inertia degradation rates

$\dot{m}_{Ii}, \dot{m}_{IIi}$  mass degradation rates

$\mathbf{R}_i$  vector thrust developed by  $i^{th}$  rocket

$R_i$  magnitude of thrust developed by  $i^{th}$  rocket

$R_i$  rated thrust level of  $i^{th}$  rocket

$t_{ie}$  time at which  $i^{th}$  rocket starts firing

$t_{if}$  time at which  $i^{th}$  rocket ceases firing

$\lambda_{ix}, \lambda_{iy}, \lambda_{iz}$  cosines of angles between thrust vector for rocket  $i$  and the  $x'_I, y'_I, z'_I$  axes

### 2. Forces

The forces described in this subsection are of the same form as those described in Section VI D, except that the rocket forces are constant with time.

If  $t$  is not between  $t_{ie}$  and  $t_{if}$ , rocket  $i$  develops no thrust; however, if  $t$  is between  $t_{ie}$  and  $t_{if}$ , it is assumed to develop full thrust. Therefore, the thrust magnitude is as described by Eq. (127)

$$\begin{aligned} \text{If } t < t_{ie} &\quad \text{then } R_i = 0 \\ \text{If } t_{ie} \leq t \leq t_{if} &\quad \text{then } R_i = R_i \\ \text{If } t_{if} < t &\quad \text{then } R_i = 0 \end{aligned} \quad (127)$$

Consequently, the components of the rocket contribution to the generalized forces are as given in Eqs. (128) through (139).

$$\mathcal{R}_{Ix} = \mathbf{a}^{(1)T} \cdot \left[ \sum_i R_i \lambda_i \right] \quad (128)$$

$$\mathcal{R}_{Iy} = \mathbf{a}^{(2)T} \cdot \left[ \sum_i R_i \lambda_i \right] \quad (129)$$

$$\mathcal{R}_{Iz} = \mathbf{a}^{(3)T} \cdot \left[ \sum_i R_i \lambda_i \right] \quad (130)$$

$$\mathcal{R}_{I\theta} = \left[ \sum_i R_i (\mathbf{r}'_{Ii} \times \boldsymbol{\lambda}_i) \right] \cdot \mathbf{e}'_{I\theta} \quad (131)$$

$$\mathcal{R}_{I\phi} = \left[ \sum_i R_i (\mathbf{r}'_{Ii} \times \boldsymbol{\lambda}_i) \right] \cdot \mathbf{e}'_{I\phi} \quad (132)$$

$$\mathcal{R}_{I\psi} = \left[ \sum_i R_i (\mathbf{r}'_{Ii} \times \boldsymbol{\lambda}_i) \right] \cdot \mathbf{e}'_{I\psi} \quad (133)$$

$$\mathcal{R}_{IIx} = \mathbf{b}^{(1)T} \cdot \left[ \sum_i R_i \rho_i \right] \quad (134)$$

$$\mathcal{R}_{Iiy} = \mathbf{b}^{(2)T} \cdot \left[ \sum_i R_i \rho_i \right] \quad (135)$$

$$\mathcal{R}_{Iiz} = \mathbf{b}^{(3)T} \cdot \left[ \sum_i R_i \rho_i \right] \quad (136)$$

$$\mathcal{R}_{II\theta} = \left[ \sum_i R_i (\mathbf{r}'_{IIi} \times \boldsymbol{\rho}_i) \right] \cdot \mathbf{e}'_{II\theta} \quad (137)$$

$$\mathcal{R}_{II\phi} = \left[ \sum_i R_i (\mathbf{r}'_{IIi} \times \boldsymbol{\rho}_i) \right] \cdot \mathbf{e}'_{II\phi} \quad (138)$$

$$\mathcal{R}_{II\psi} = \left[ \sum_i R_i (\mathbf{r}'_{IIi} \times \boldsymbol{\rho}_i) \right] \cdot \mathbf{e}'_{II\psi} \quad (139)$$

### 3. Mass and Moment of Inertia Decreases

During the firing of the rockets, the mass and the moments of inertia (of the body on which the rocket is mounted) will decrease. The amount of mass remaining is shown in Eqs. (140) through (145).

If

$$t \leq t_{ie} \quad \text{then } m_I = m_{I0} \quad (140)$$

$$t_{ie} \leq t < t_{if} \quad \text{then } m_I = m_{I0} - (t - t_{ie}) \sum_i \dot{m}_{Ii} \quad (141)$$

$$t_{if} \leq t \quad \text{then } m_I = m_{I0} - (t_{if} - t_{ie}) \sum_i \dot{m}_{Ii} \quad (142)$$

$$t \leq t_{ie} \quad \text{then } m_{II} = m_{II0} \quad (143)$$

$$t_{ie} < t < t_{if} \quad \text{then} \quad m_{II} = m_{II0} - (t - t_{ie}) \sum_i m_{IIi} \quad (144)$$

$$t_{if} \leq t \quad \text{then} \quad m_{II} = m_{II0} - (t_{if} - t_{ie}) \sum_i m_{IIi} \quad (145)$$

The principal moments of inertia will decrease in a similar fashion. It is assumed that the inertia decrease can be adequately approximated by a linearization. It is also assumed that the mass loss has no effect on the products of inertia.

### G. Hard-Mounted Springs on Body II

The usual linear-spring assumption has been made in this section; however, there is provision for the use of an experimental spring efficiency factor. No provision has been made for the spring-tip sliding friction. In practice, the static coefficient of friction is usually several times higher than the necessary value to prevent slippage so that the constraint mode will almost always be present (see Appendix H).

#### 1. Symbols

- $j_i$  length of extension of  $i^{th}$  spring
- $N$  restriction index (if  $N = 0$ , there is no constraint; if  $N > 1$ , the constraint is operating)
- $\mathbf{r}_{IIi}$  location of tip of spring  $i$  in the inertial CS (see Appendix B)
- $S_i$  force in  $i^{th}$  spring
- $S_{if}$  residual spring force
- $S_{i0}$  initial force in  $i^{th}$  spring
- $\eta$  spring efficiency factor
- $\rho_{ix}, \rho_{iy}, \rho_{iz}$  cosines of angles between spring  $i$  and body II axes

#### 2. Longitudinal Forces in Springs

The vector representation of the  $i^{th}$  spring force is given by Eqs. (146) and (147).

If

$$0 \leq k_i j_i < S_{i0} - S_{if}$$

then

$$\mathbf{S}_i = \eta^2 (S_{i0} - k_i j_i) (\rho_{ix} \mathbf{e}_{IIx'} + \rho_{iy} \mathbf{e}_{IIfy'} + \rho_{iz} \mathbf{e}_{IIz'}) \quad (146)$$

If

$$k_i j_i \geq S_{i0} - S_{if}$$

then

$$\mathbf{S}_i = 0 \quad (147)$$

#### 3. Generalized Forces

Because the Lagrange multipliers automatically supply the forces necessary to prevent slippage, only the longitudinal forces in the springs need be considered.

Then

$$\mathcal{G}_{IIx} = -\mathbf{a}^{(1)T} \sum_i S_i \mathbf{p}_i = -\mathcal{G}_{Ix} \quad (148)$$

$$\mathcal{S}_{IIy} = -\mathbf{a}^{(2)T} \sum_i S_i \mathbf{p}_i = -\mathcal{S}_{Iy} \quad (149)$$

$$\mathcal{S}_{IIZ} = -\mathbf{a}^{(3)T} \sum_i S_i \mathbf{p}_i = -\mathcal{S}_{IZ} \quad (150)$$

$$\mathcal{S}_{II\theta} = -\left[ \sum_i S_i (\mathbf{r}'_{IIi} \times \mathbf{p}_i) \right] \cdot \mathbf{e}'_{II\theta} \quad (151)$$

$$\mathcal{S}_{II\phi} = -\left[ \sum_i S_i (\mathbf{r}'_{IIi} \times \mathbf{p}_i) \right] \cdot \mathbf{e}'_{II\phi} \quad (152)$$

$$\mathcal{S}_{II\psi} = -\left[ \sum_i S_i (\mathbf{r}'_{IIi} \times \mathbf{p}_i) \right] \cdot \mathbf{e}'_{II\psi} \quad (153)$$

$$\mathcal{S}_{I\theta} = \left\{ \sum_i S_i [(\mathbf{r}'_{IIi} - \mathbf{r}_I) \times (\mathbf{A}_{II}^{-1} \mathbf{p}_i)] \right\} \cdot \mathbf{e}_{I\theta} \quad (154)$$

$$\mathcal{S}_{I\phi} = \left\{ \sum_i S_i [(\mathbf{r}'_{IIi} - \mathbf{r}_I) \times (\mathbf{A}_{II}^{-1} \mathbf{p}_i)] \right\} \cdot \mathbf{e}_{I\phi} \quad (155)$$

$$\mathcal{S}_{I\psi} = \left\{ \sum_i S_i [(\mathbf{r}'_{IIi} - \mathbf{r}_I) \times (\mathbf{A}_{II}^{-1} \mathbf{p}_i)] \right\} \cdot \mathbf{e}_{I\psi} \quad (156)$$

where the unit vectors have been previously defined.

The equation for  $\mathbf{r}_{IIi}$  is derived in Appendix B:

$$\mathbf{r}_{IIi} = \mathbf{r}_{II} + \mathbf{A}_{II}^T \mathbf{r}'_{IIi} + j_i \mathbf{A}_{II}^T \mathbf{p}_i$$

Clearly,  $\mathbf{r}_{IIi} - \mathbf{r}_I$  is the vector connecting body I's CM and the tip of spring  $i$ , but expressed in inertial coordinates.

## H. Universally-Jointed Springs

In actual practice, universally-jointed springs are rarely used. They do, however, closely approximate hard-mounted springs when the guiding is poor, and the relative motion is small (see Appendix H).

### 1. Symbols

- $\mathbf{d}_i$  vector connecting spring attachment points
- $k_i$  spring rate of  $i^{th}$  spring
- $\mathbf{W}_i$  force in  $i^{th}$  spring
- $\mathbf{W}_{if}$  residual spring force
- $\mathbf{W}_{i0}$  initial force in  $i^{th}$  spring
- $w_i$  a temporary notation convention (see Eq. 159)
- $\eta$  spring efficiency factor

### 2. Forces

With universal joints at both ends, the spring force lines up with the vector connecting the two attachment points.

If

$$0 \leq k_i(|d_i| - |d_{i0}|) < W_{i0} - W_{if}$$

then

$$\mathbf{W}_i = \eta^2 [W_{i0} - k_i(|\mathbf{d}_i| - |\mathbf{d}_{i0}|)] \frac{\mathbf{d}_i}{|\mathbf{d}_i|} \quad (157)$$

If

$$k_i d_i \geq W_{i0} - W_{if}$$

then

$$\mathbf{W}_i = 0 \quad (158)$$

For simplicity in notation, let

$$w_i = \frac{\eta^2 [W_{i0} - k_i(|d_i| - |d_{i0}|)]}{|d_i|} \quad (159)$$

Then

$$\mathbf{W}_i = w_i \mathbf{d}_i \quad (160)$$

The generalized forces are given in Eqs. (161) through (166).

$$\mathcal{M}_{Ix} = \sum_i w_i d_{ix} = -\mathcal{M}_{Iix} \quad (161)$$

$$\mathcal{M}_{Iy} = \sum_i w_i d_{iy} = -\mathcal{M}_{Iiy} \quad (162)$$

$$\mathcal{M}_{Iz} = \sum_i w_i d_{iz} = -\mathcal{M}_{Iiz} \quad (163)$$

$$\mathcal{M}_{I\theta} = \left\{ \sum_i w_i [(\mathbf{A}_I^T \mathbf{r}'_{Ii}) \times \mathbf{d}_i] \right\} \cdot \mathbf{e}_{I\theta} \quad (164)$$

$$\mathcal{M}_{I\phi} = \left\{ \sum_i w_i [(\mathbf{A}_I^T \mathbf{r}'_{Ii}) \times \mathbf{d}_i] \right\} \cdot \mathbf{e}_{I\phi} \quad (165)$$

$$\mathcal{M}_{I\psi} = \left\{ \sum_i w_i [(\mathbf{A}_I^T \mathbf{r}'_{Ii}) \times \mathbf{d}_i] \right\} \cdot \mathbf{e}_{I\psi} \quad (166)$$

The values of  $\mathcal{M}_{II\theta}, \mathcal{M}_{II\phi}, \mathcal{M}_{II\psi}$  are obtained by replacing I by II in Eqs. (164) through (166).

## VII. EQUATIONS OF MOTION

### A. Unconstrained Case

The unconstrained equations of motion are determined from the Lagrange formulation as outlined in Section VB. The details of the calculation of the terms may be found in Appendix I. The equations of motion are given in Eqs. (167) through (172).

$$m\ddot{x} = \mathcal{Q}'_x \equiv p'_x \quad (\text{from } q = x) \quad (167)$$

$$m\ddot{y} = \mathcal{Q}'_y \equiv p'_y \quad (\text{from } q = y) \quad (168)$$

$$m\ddot{z} = \mathcal{Q}'_z \equiv p'_z \quad (\text{from } q = z) \quad (169)$$

$$m_{11}\ddot{\theta} + m_{12}\ddot{\phi} + m_{13}\ddot{\psi} = p_1 + \mathcal{Q}'_\theta \equiv p'_1 \quad (\text{from } q = \theta) \quad (170)$$

$$m_{21}\ddot{\theta} + m_{22}\ddot{\phi} + m_{23}\ddot{\psi} = p_2 + \mathcal{Q}'_\phi \equiv p'_2 \quad (\text{from } q = \phi) \quad (171)$$

$$m_{31}\ddot{\theta} + m_{32}\ddot{\phi} + m_{33}\ddot{\psi} = p_3 + \mathcal{Q}'_\psi \equiv p'_3 \quad (\text{from } q = \psi) \quad (172)$$

where

$$m_{11} = I_{xx}(c^2\psi) - 2I_{xy}(s\psi c\psi) + I_{yy}(s^2\psi) \quad (173)$$

$$m_{12} = [(I_{xx} - I_{yy})(s\psi c\psi) + I_{xy}(c^2\psi - s^2\psi)](s\theta) + [I_{xz}(c\psi) - I_{yz}(s\psi)](c\theta) \quad (174)$$

$$m_{13} = I_{xz}(c\psi) - I_{yz}(s\psi) \quad (175)$$

$$m_{21} = m_{12} \quad (176)$$

$$m_{22} = (s^2\theta)[I_{xx}(s^2\psi) + 2I_{xy}(s\psi c\psi) + I_{yy}(c^2\psi)] + 2(s\theta c\theta)[I_{xz}(s\psi) + I_{yz}(c\psi)] + (c^2\theta)I_{zz} \quad (177)$$

$$m_{23} = (s\theta)[I_{xz}(s\psi) + I_{yz}(c\psi)] + (c\theta)I_{zz} \quad (178)$$

$$m_{31} = m_{13} \quad (179)$$

$$m_{32} = m_{23} \quad (180)$$

$$m_{33} = I_{zz} \quad (181)$$

$$\begin{aligned} p_1 = & (s\theta)\dot{\phi}\dot{\psi}[4I_{xy}(s\psi c\psi) - (I_{xx} - I_{yy})(c^2\psi - s^2\psi) - I_{zz}] + 2\dot{\phi}\dot{\psi}[(I_{xx} - I_{yy})(s\psi c\psi) + I_{xy}(c^2\psi - s^2\psi)] \\ & + \dot{\psi}^2[I_{xz}(s\psi) + I_{yz}(c\psi)] + \dot{\phi}^2(s\theta c\theta)[I_{xx}(s^2\psi) + 2I_{xy}(s\psi c\psi) + I_{yy}(c^2\psi) - I_{zz}] \\ & + \dot{\phi}^2(c^2\theta - s^2\theta)[I_{xz}(s\psi) + I_{yz}(c\psi)] + 2(c\theta)[I_{xz}(s\psi) + I_{yz}(c\psi)] \end{aligned} \quad (182)$$

$$\begin{aligned} p_2 = & -2\dot{\phi}\{\dot{\theta}(s\theta c\theta)[I_{xx}(s^2\psi) + 2I_{xy}(s\psi c\psi) + I_{yy}(c^2\psi) - I_{zz}] + \dot{\psi}(s^2\theta)[(I_{xx} - I_{yy})(s\psi c\psi) \\ & + I_{xy}(c^2\psi - s^2\psi)] + \dot{\theta}(c^2\theta - s^2\theta)[I_{xz}(s\psi) + I_{yz}(c\psi)] + \dot{\psi}(s\theta c\theta)[I_{xz}(c\psi) - I_{yz}(s\psi)]\} \\ & - \dot{\theta}\{\dot{\theta}(c\theta)[(I_{xx} - I_{yy})(s\psi c\psi) + I_{xy}(c^2\psi - s^2\psi) + \dot{\psi}(s\theta)[(I_{xx} - I_{yy})(c^2\psi - s^2\psi) - 4I_{xy}(s\psi c\psi)] \\ & - \dot{\theta}(s\theta)[I_{xz}(c\psi) - I_{yz}(s\psi)]\} - \dot{\psi}\{\dot{\psi}(s\theta)[I_{xz}(c\psi) - I_{yz}(s\psi)] - \dot{\theta}(s\theta)I_{zz}\} \end{aligned} \quad (183)$$

$$\begin{aligned} p_3 = & -2\dot{\phi}\{\dot{\theta}(c\theta)[I_{xz}(s\psi) + I_{yz}(c\psi)]\} + \dot{\phi}(s\theta)\{(c^2\psi - s^2\psi)[I_{xx} - I_{yy}]\dot{\theta} + I_{xy}\phi(s\theta)\} + \dot{\theta}I_{zz} \\ & + (I_{xx} - I_{yy})(s\psi c\psi)[\dot{\phi}^2(s^2\theta) - \dot{\theta}^2] - 4I_{xy}\dot{\theta}\phi(s\theta s\psi c\psi) - [I_{xz}(c\psi) - I_{yz}(s\psi)]\dot{\phi}^2(s\theta c\theta) \\ & - I_{xy}\dot{\theta}^2(c^2\psi - s^2\psi) \end{aligned} \quad (184)$$

It is understood that Eqs. (167) through (184) are to be applied to both body I and body II.

$$\mathcal{Q}'_s = k\mathcal{Q}_s, \quad \text{where } k = 385.7 \text{ in./sec}^2 \quad (185)$$

The unconstrained equations of motion can then be written as

$$\mathbf{M}\ddot{\mathbf{q}} = \mathbf{f} \quad (186)$$

where

$$\mathbf{M} = \begin{bmatrix} m_I & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & m_I & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & m_I & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & m_{11I} & m_{12I} & m_{13I} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & m_{21I} & m_{22I} & m_{23I} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & m_{31I} & m_{32I} & m_{33I} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & m_{II} & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{II} & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{II} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{11II} & m_{12II} & m_{13II} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{21II} & m_{22II} & m_{23II} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{31II} & m_{32II} & m_{33II} \end{bmatrix} \quad (187)$$

$$\ddot{\mathbf{q}} = \begin{bmatrix} \ddot{x}_I \\ \ddot{y}_I \\ \ddot{z}_I \\ \ddot{\theta}_I \\ \ddot{\phi}_I \\ \ddot{\psi}_I \\ \ddot{x}_{II} \\ \ddot{y}_{II} \\ \ddot{z}_{II} \\ \ddot{\theta}_{II} \\ \ddot{\phi}_{II} \\ \ddot{\psi}_{II} \end{bmatrix} \quad \mathbf{f} = \begin{bmatrix} p'_{xI} \\ p'_{yI} \\ p'_{zI} \\ p'_{\theta I} \\ p'_{\phi I} \\ p'_{\psi I} \\ p'_{xII} \\ p'_{yII} \\ p'_{zII} \\ p'_{\theta II} \\ p'_{\phi II} \\ p'_{\psi II} \end{bmatrix} \quad (188)$$

(188)

(189)

### B. Constrained Case

Since it is assumed that both constraint conditions will not be required at the same time, a set of constrained equations of motion has been derived for each constraint condition. These equations, with their attendant definitions, are given in Appendix J (see Appendixes K and L). Each set consists of 15 second-order differential equations.

### C. Numerical Solution

In either the constrained or unconstrained case, the equations of motion are solved for the accelerations by Cramer's rule. The accelerations are then doubly integrated by the Adams-Moulton technique.

## VIII. LIMITATIONS ON THE ANALYSIS AND SOLUTION ACCURACY

The limitations on the use of this program are established by the mathematical model described in this report. Considerable flexibility within the model can be obtained by ingenious use of its facets; the force equations and constraint modes need not be used for their nominal purposes. For example, the pin-puller delay can be used in conjunction with a very large  $m_1$  to obtain a fixed-point constraint on body II. A large number of other potentialities exist.

In view of the complexity of the program and the wide range of possible problem situations, computational ac-

curacy is difficult to define. With the generalized coordinates given, the forces are obtained by straightforward noniterative procedures, so that the only errors introduced in computing these forces would be because of truncation. The relatively unknown area is then the integration of the equations of motion. As detailed in the computer program portion of this report (Sections IX through XIII), the equations are integrated with a routine that changes step size in an effort to maintain a constant integration error that is a function of the initial step size selected. It is recommended that different step sizes be tried on a new problem; a comparison of the results will indicate approximately the accuracy of integration.

## IX. DETAILED DESCRIPTION OF THE COMPUTER PROGRAM: INPUT LINK, INTEGRATION LINK, AND PLOTTING LINK

The program is written in the FORTRAN/FAP system, and is divided into three chain links (input, integration, and plotting). The first link reads and prints the input data; the second link integrates the differential equations; the third link prepares output data for plotting (see Figs. 5 and 6). The detailed description of the integration technique (FMARK) is relegated to Appendix M. Rather than

the conventional flow-chart approach, the discussion of the links is referenced to the actual FORTRAN listing (see Appendix N).

### A. Input Link

All appropriate input data are read and printed at the beginning of this link. Force input and initialization begins after FORMAT statement 845, and is controlled by the values of the indicators. These indicators are: ICD, coulomb drag; IPR, pyrotechnic; ICG, cold gas; IPN, pneumatic; IRK, rockets; ISP, hard-mounted springs; ISU, universally jointed springs; and IPN, pin-puller constraint. Input for a force is bypassed if its indicator is zero. If the indicator is non-zero, input/output is performed along with the initial calculations on the forces and conversion from drawing board CS to body-fixed CS. All parameters needed for the force calculations are transmitted to the integration link through COMMON storage. No special subroutines are used in the input link.

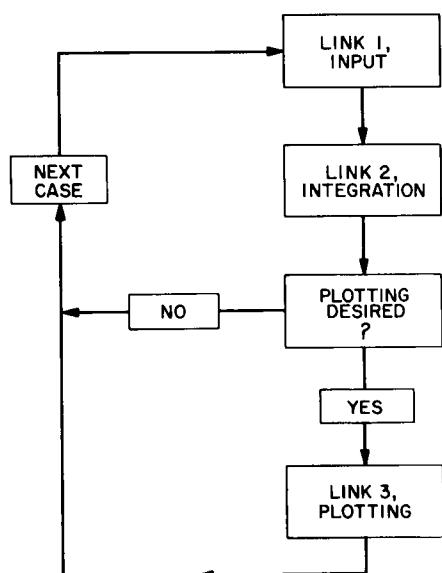

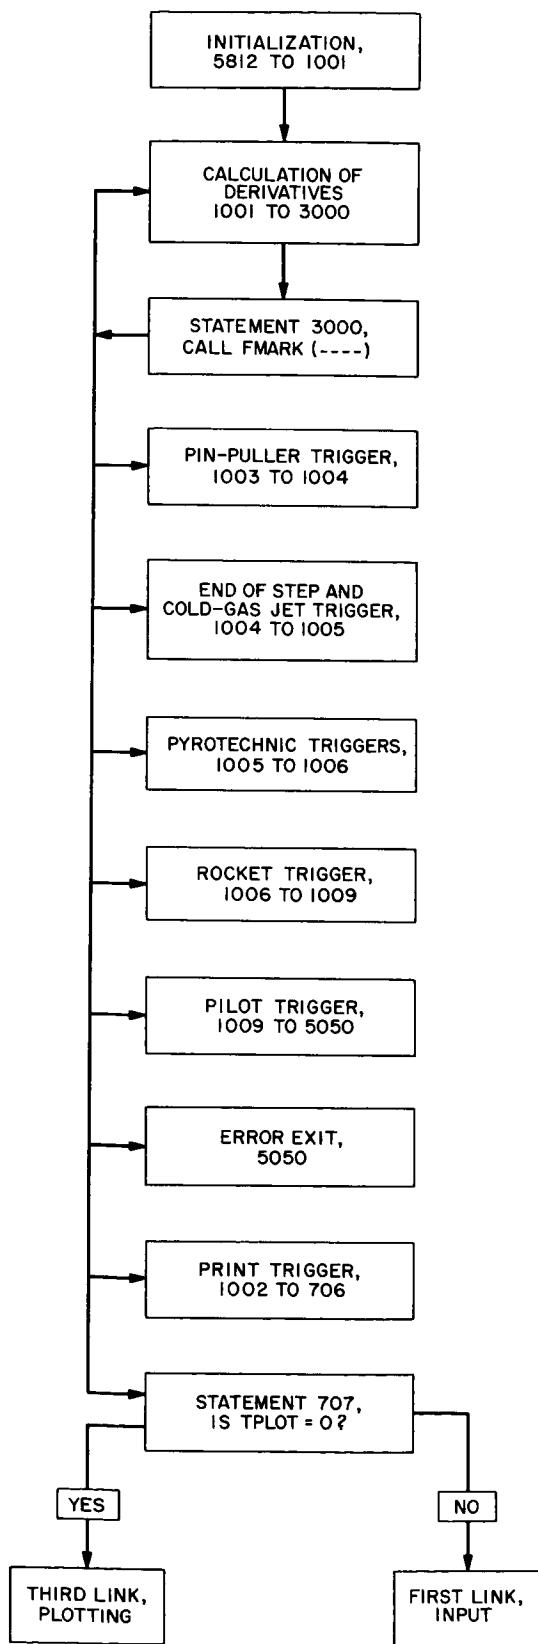

Fig. 5. Program main flow

Of special note is the sentinel ICLAG, which, at the beginning of the link = 1. If the hard-mounted spring constraint is used, ICLAG = -1 (statement 6552); however, if the pin-puller constraint is used, ICLAG = 0 (above statement 43). Both constraints cannot be working at the same time, but the spring constraint can be used after the pin-puller constraint terminates.

## B. Integration Link

### 1. Integration Subroutine, FMARK

The FMARK integration subroutine (statement 3000) applies the Adams-Moulton method with automatic error control. The computed GO TO statement, following the call to FMARK, is an integral part of the subroutine. The variables in the calling sequence are defined as follows:

KIK	fixed-point variable that must correspond to the variable of the computed GO TO statement
HB	an array of dimension 6 [i.e., HB(1), . . . , HB(6)] that contains parameters that monitor the Adams-Moulton automatic error control
HB (1) = $\Delta t$	step size at the start of integration
HB (2) = 1	used to prevent unnecessary reduction in the step size
HB (3) = 0.00025	minimum allowable step size
HB (4) = 0.01	maximum allowable step size
HB (5) = $10^{-8}$	relative lower bound on truncation error
HB (6) = $10^{-6}$	relative upper bound on truncation error
NH	an array of dimension 6 [i.e., NH(1), . . . , NH(6)] that supplies FMARK with needed parameters
NH (1) = 24	total number of first order differential equations
NH (2) = NH (1)	
NH (3)	not used
NH (4)	not used
NH (5) = 4	number of backward differences used
NH (6)	not used
IVP	set to zero, denoting that the independent variable is carried in single precision
IPHI	set to 4 denoting Adams-Moulton automatic error control mode
1,1	first value of 1, in the calling sequence, used to supply the location

Fig. 6. Flow of integration link

(to FMARK) of the portion of the program where the derivatives are calculated (FMARK sets KIK = 1, then executes the computed GO TO statement); second value of 1 needed to suppress option in FMARK

- 2,2 first value of 2, in the calling sequence, used to supply the location (to FMARK) of the *end of step area* (FMARK sets KIK = 2 to transfer to the *end of step area*); second value of 2 is used to initialize triggers
- (I, TRG) 8 sets of variables containing a fixed point and a floating point number that define a *trigger* (when T = TRG, KIK set = to I; computed GO TO statement is executed)
- 0 denotes end of calling sequence

When FMARK is entered (i.e., when statement 3000 is executed) it expects the *initial* value for the independent variable T stored in the *highest* location in COMMON. Since T could be carried in double precision, a dummy variable (ZERO) is adjacent to T. FMARK expects the 24 initial values of the dependent variables to be stored in COMMON just below T and ZERO. FMARK will transfer control to the area of the program where the derivatives are to be calculated; it expects these derivatives supplied in COMMON just below the values of the independent variables. Thus, the first COMMON of this link is

COMMON T, ZERO, V1, V2, YDOT1, YDOT2

DIMENSION V1 (18), V2 (6), YDOT1 (18), YDOT2 (6)

where YDOT1 (I) is the derivative of V1 (I) and the derivative area of the program computes YDOT1, YDOT2 using V1, V2. After the derivatives have been calculated and placed in COMMON, control is returned to FMARK by

CALL ROUT (0)

Triggers can be either *on* or *off*. Turning a trigger on can be accomplished by

CALL TRMOD (I,1)

where I is the number of the trigger in the calling sequence (the first trigger is number 0). A trigger is turned off by

CALL TRMOD (I,0)

Control is returned to FMARK from a trigger by

CALL ROUT (0)

The following is a list of the triggers:

Trigger No.	Calling sequence designation	Program location	Function
0	2,TRIG3	1004	Cold gas on
1	3,TRIG2	1003	Pin-puller constraint off
2	4,TRIG1	1002	Print output
3	5,TRIG4	1005	First pyrotechnic shot
4	6,TROC	1006	Rockets on and off
5	7,PYRO2	1007	Second pyrotechnic shot
6	8,PYRO3	1008	Third pyrotechnic shot
7	9,PLOT	1009	Plot output

In certain cases, control is not returned to FMARK by calling ROUT (0). If a discontinuity has occurred in a derivative (e.g., pyrotechnic), the program again calls FMARK. This is done to recompute the backward differences.

The main function of the end of step area is to verify that  $\theta$  is not near zero. If  $\theta$  is near zero, the transformation is made and the integration continues.

## 2. Main Program

The DO loop that ends at statement 5812 puts the hard-mounted spring locations and directions in a more convenient form for later computation. From statement 5812 to statement 6677, the maximum integration time (WIL1) is tested to see if the integration will be terminated when the forces become zero (yes IFORCE = -1, no IFORCE = 0). Triggers are set up and turned on from 55 to 704. The program, up to the call to subroutine GET (1001), sets up initial conditions for the dependent variables and the arrays of HB and NH along with miscellaneous sentinels.

The area of the link beginning with statement 1001 and ending at statement 6007 calculates the derivatives for FMARK. Just before 3000, there is logic to either CALL ROUT (0), the normal return to FMARK from the derivative area, or CALL FMARK( · · · ). The latter branch is taken the first time through the derivative area and when a discontinuity has occurred in the derivatives.

The function of GET (1001) (which communicates to the link through COMMON) is to compute the transfor-

mation matrixes  $\mathbf{A}_I$ ,  $\mathbf{A}_{II}$ , and  $\dot{\mathbf{A}}_I$ ,  $\dot{\mathbf{A}}_{II}$ , coefficients  $m_{ij}$  and terms  $p_i$  for the unconstrained equations of motion and, if necessary, the matrix  $\mathbf{F}$  and terms  $r_i$  for the constrained equations of motion. After GET, the link checks the force indicators (3032 to 67) and computes the necessary forces. The twelve force components are computed from the particular force components in the DO loop starting at 69. If  $ICLAG \leq 0$ , the constrained case must be solved (414). This is done from statements 74 up to 75. The subroutine SOLVE finds the solution for the 15 linear equations of the constrained case. The derivatives for the unconstrained case are computed from 75 to 6007.

The remainder of the link (the area below statement 3000) contains the triggers and the end of step area. Control is transferred to 1003 when the pin-puller constraint terminates. In some cases, the spring constraint will be used after the pin-puller constraint. Thus, a test is made for the spring constraint ( $N \geq 2$  yes). ICLAG is set to the proper value and a printout is made.

Statement 1004 serves as the cold-gas jet trigger and the end of step area. The array TCO contains the time cold-gas jets are turned on—in ascending order. The fixed-point variable (ICOLD) denotes the next jet to be turned on; thus  $ICOLD = 1, ICG$ . If the trigger has just been activated [i.e.,  $T = TC(1, ICOLD)$ ], control is transferred to 8010. Statement 8007 is executed after the last jet has been turned on, otherwise 8006 is executed. In either case, LDER = 1 for a restart. If  $LDER < 0$  (200), a force has just ceased and a restart has to be made. If  $ISS(1) + ISS(2) \neq 0$  (6519), the spring constraint is acting and a spring must be switched. The area of the program from statement 6522 up to 1005 checks the size of  $\theta_I$  and  $\theta_{II}$ . If either value of  $\theta$  is close to zero, a rotation of the body axes is made. Exit to FMARK is made when statement 426 transfers to 403.

The first pyrotechnic trigger starts at 1005, the second at 1007, and the third at 1008. The logic assumes that the triggers are fixed in chronological order. The firing of the triggers is completed in  $\Delta t$  sec (Runge-Kutta integration is used over this interval). The rocket trigger is placed at statement 1006, and the plot trigger is at 1009. For the plot trigger, all possible variables are output on tape B1; they will be read in for plotting in the next link. Statement 5050 is executed if an error occurs in FMARK. A typical error would be an activated trigger that has an execution time less than that of the current value of the independent variable.

The output trigger is placed at 1002. The subroutine STEP enters FMARK and finds the current step size.

Body axis rates are computed and placed in the array CB (301). Other variables computed are speed (V), rate about instantaneous axis (W1), and magnitude of body axis rate vector (WP1). Separation distance and velocity are computed below 350. If a constraint is working, the constraint values FQQ1, FQQ2, and FQQ3 are printed (6663). The constraint values correspond to  $d_{ix}$ ,  $d_{iy}$ , and  $d_{iz}$  for the pin-puller and  $g_x$ ,  $g_z$ ,  $e_{az}e_{bx} - e_{ax}e_{bz}$  for the spring constraint. If IHY  $\neq 0$ , the transformation matrixes ( $\mathbf{A}_I$ ,  $\mathbf{A}_{II}$ ) are output (6670). The logic from 8001 to 6501 controls the termination of the program. If IFORCE = 0, the job terminates only when the independent variable, T, is greater than WIL1 or when all forces cease. A force must be on ( $SUN \neq 0$ ) before termination for null force ( $SUN = 0$ ). If TPLOT = 0 (706), plotting is not done, and control returns to the input link. Statement 5000 prints input errors. Control goes to 5002 if a  $3 \times 3$  matrix used to find the rotational acceleration is singular.

### 3. Other Subroutines

a. **Constraint subroutine.** The subroutine GET calculates those parameters needed to find the acceleration components, the rotational matrixes ( $\mathbf{A}_I$ ,  $\mathbf{A}_{II}$ ,  $\dot{\mathbf{A}}_I$ ,  $\dot{\mathbf{A}}_{II}$ ) and, if necessary, the  $15 \times 15$  constraint matrix  $\mathbf{F}$ .

Initially, the subroutine sets IM = 0 to denote calculations for body I; IM = 1 denotes calculations for body II. After computations for body I trigonometric functions (after 5004), A and AD are computed—note that IM2 = IM + 1 stores the  $\mathbf{A}_I$ ,  $\dot{\mathbf{A}}_I$  and  $\mathbf{A}_{II}$ ,  $\dot{\mathbf{A}}_{II}$  in different areas. A test is made just before 48, and  $m_{ij}$  and  $p_i$  for either body I or II are computed. The control then goes to statement 41. Between 101 and 3, matrixes needed for the constrained case ( $ICLAG \leq 0$ ) are computed (see Table 1). At 104, IM is tested to see if body II computations have been made. If the computations have been made, control goes to 43 to test whether the constrained or unconstrained case is running. Calculations needed for both pin-puller and spring constraints are made after statement 106, then a test is made to determine which constraint is acting. The subroutine from 111 up to 110 calculates elements of the F matrix and  $r_1$ ,  $r_2$ , and  $r_3$ —stored in CA (1), CA (2), CA (3)—for the pin-puller. All code below 110 calculates the same values for the spring constraint.

b. **Force subroutines.** Almost all the routines use the variable LDER, which controls integration restart. At each entry, a test is made in these routines to see if a force terminates. If a force does terminate, a discontinuity can occur in the force function, and an integration restart

**Table 1. Identification of matrixes**

Matrix	Statement
$\mathbf{A}_I$	$\mathbf{A}(1,1,1)$
$\dot{\mathbf{A}}_{II}$	$\mathbf{A}(1,1,2)$
$\dot{\mathbf{A}}_I$	$\mathbf{AD}(1,1,1)$
$\dot{\mathbf{A}}_{II}$	$\mathbf{AD}(1,1,2)$
$\frac{\partial \mathbf{A}_I}{\partial q_k} \quad k = 4,5,6$	$\mathbf{WAP}(1,1, K-3)$
$\frac{\partial \mathbf{A}_{II}}{\partial q_k} \quad k = 10,11,12$	$\mathbf{WAP}(1,1, K-6)$
$\frac{d}{dt} \frac{\partial \mathbf{A}_I}{\partial q_k} \quad k = 4,5,6$	$\mathbf{WAPP}(1,1, K-3)$
$\frac{d}{dt} \frac{\partial \mathbf{A}_{II}}{\partial q_k} \quad k = 10,11,12$	$\mathbf{WAPP}(1,1, K-6)$
$r_{II}'$	$\mathbf{WRP1}(1,1)$
$r_{IIm}'$	$\mathbf{WRP1}(1,2)$
$r_{III}'$	$\mathbf{WRP2}(1,1)$
$r_{IIIm}'$	$\mathbf{WRP2}(1,2)$
$\rho_I$	$\mathbf{WRH}(1,1)$
$\rho_m$	$\mathbf{WRH}(1,2)$
$T$	$\mathbf{TEE}(1,1)$
$\dot{T}$	$\mathbf{TD}(1,1)$

must be made. In this case, LDER is set to -1; restart is made when the end of step area is entered.

The input and output calling sequence for the force subroutines is presented for a clearer understanding of the program.

#### Coulomb drag, input

D(I)	magnitude of $i^{th}$ drag force ( $D_i$ )
DF(I)	separation distance beyond which $i^{th}$ drag force ceases ( $d_{if}$ )
XC1(I), YC1(I), ZC1(I)	location of $i^{th}$ drag force on body I in body I CS ( $x'_{Ii}$ , $y'_{Ii}$ , $z'_{Ii}$ )
XC2(I), YC2(I), ZC2(I)	location of $i^{th}$ drag force on body II in body II CS ( $x'_{IIi}$ , $y'_{IIi}$ , $z'_{IIi}$ )
ICD	number of drag forces

#### Coulomb drag, output

DD(J)	component of $\mathcal{Q}_j$ due to coulomb drag forces ( $\mathcal{Q}_j$ )
LDER	= 0, no restart $< 0$ , restart to be made after end of step

ICD1 number of drag forces that have been turned off

#### Pyrotechnics, input

PI(I)	total impulse of $i^{th}$ pyrotechnic device ( $I_i$ )
TP(I)	firing time of $i^{th}$ device ( $t_i$ )
XP2(I), YP2(I), ZP2(I)	location of $i^{th}$ device on body II in body II CS ( $x'_{IIi}$ , $y'_{IIi}$ , $z'_{IIi}$ )
UPX(I), UPY(I), UPZ(I)	direction cosine vector of the $i^{th}$ device in body II CS ( $\rho_{xi}$ , $\rho_{yi}$ , $\rho_{zi}$ )
IPR	number of devices

#### Pyrotechnics, output

EP(J) component of  $\mathcal{Q}_j$  due to pyrotechnics ( $\mathcal{E}_j$ )

#### Cold-gas jets, input

FG1(I), FG2(I)	characteristic force constants of jet $i$ ( $f_{i1}$ , $f_{i2}$ )
FG3	gas-system characteristic ( $f_3$ )

UGX(I), UGY(I), UGZ(I) cosines of angles between thrust vector for jet  $i$  and body I axis ( $\lambda_{ix}$ ,  $\lambda_{iy}$ ,  $\lambda_{iz}$ )

VGX(I), VGY(I), VGZ(I) cosines of angles between thrust vector for jet  $i$  and body II axis ( $\rho_{ix}$ ,  $\rho_{iy}$ ,  $\rho_{iz}$ )

XG1(I), YG1(I), ZG1(I) location of  $i^{th}$  jet on body I in body I CS ( $x'_{Ii}$ ,  $y'_{Ii}$ ,  $z'_{Ii}$ )

XG2(I), YG2(I), ZG2(I) location of  $i^{th}$  jet on body II in body II CS ( $x'_{IIi}$ ,  $y'_{IIi}$ ,  $z'_{IIi}$ )

GST value of jet force below which  $J_i$  may be considered zero ( $J_{st}$ )

TCG(I) time which  $i^{th}$  jet cuts off ( $t_{iI}$ )

TCO(I) time which  $i^{th}$  jet begins ( $t_{ie}$ )

ICG number of jets

*Cold-gas jets, output*GJ (J) component of  $Q_j$  due to cold-gas forces ( $\mathcal{J}_j$ )

LDER = 0, no restart

&lt; 0, restart to be made after end of step

ICGI number of jets that have been turned off

*Pneumatic forces, input*

JN regulator existence index:  
 if 0, there is no regulator;  
 if 1, there is a regulator that  
 remains closed after  $p_b$   
 $= p_p$ ; if 2, there is a regu-  
 lator that remains open  
 after  $p_b = p_p$  (J)

 cluding all lines upstream  
 of the faces of the closed  
 pistons ( $V_b$ )GAMN ratio of specific heats for  
 working fluid ( $\gamma$ )AN (I) area of  $i^{th}$  piston face ( $A_i$ )RAX (I) distance at which  $i^{th}$  piston  
 separates ( $j_{max, i}$ )VNX (I), VNY (I), VNZ (I) cosines of angles between  
 piston rod  $i$  and the  $x'_{II}, y'_{II},$   
 $z'_{II}$  axes ( $\rho_{ix}$ ), ( $\rho_{iy}$ ), ( $\rho_{iz}$ )XN1 (I), YN1 (I), ZN1 (I) location of  $i^{th}$  piston on  
 body I in body I CS ( $x'_{Ii}$ ),  
 $(y'_{Ii}), (z'_{Ii})$ XN2 (I), YN2 (I), ZN2 (I) location of  $i^{th}$  piston on  
 body II in body II CS ( $x'_{IIi}$ ),  
 $(y'_{IIi}), (z'_{IIi})$ PPN (I)  $(p_{pi}) A_i$ EQP (I)  $j_{eqp, i}$ PNEM (I)  $(j_{eqp, i}) A_i$ 

IPN number of pneumatic forces

*Pneumatic forces, output*XN (J) component of  $Q_j$  due to pneumatic forces  
 $(\mathcal{N}_j)$ 

LDER = 0, no restart

&lt; 0, restart to be made after end of step

IPN1 number of pneumatics that have been turned  
 off*Rockets, input*

IRK number of rockets

RR (I) magnitude of thrust devel-  
 oped by  $i^{th}$  rocket ( $R_i$ )TE (I) time at which  $i^{th}$  rocket  
 starts firing ( $t_{ie}$ )TF (I) time at which  $i^{th}$  rocket  
 ceases firing ( $t_{if}$ )RUM the sum  $\Sigma \dot{m}_{Ii}$ PUM the sum  $\Sigma \dot{m}_{IIIi}$ URX (I), URY (I), URZ (I) cosines of angles between  
 thrust vector for rocket  $i$   
 and the  $x'_I, y'_I, z'_I$  axes ( $\lambda_{ix}$ ),  
 $(\lambda_{iy}), (\lambda_{iz})$ VRX (I), VRY (I), VRZ (I) cosines of angles between  
 thrust vector for rocket  $i$   
 and the  $x'_{II}, y'_{II}, z'_{II}$  axes  
 $(\rho_{ix}), (\rho_{iy}), (\rho_{iz})$ 

FM10, FM20 initial values of mass

XR1 (I), YR1 (I), ZR1 (I) location of  $i^{th}$  rocket on  
 body I in body I CS ( $x'_{Ii}$ ),  
 $(y'_{Ii}), (z'_{Ii})$ XR2 (I), YR2 (I), ZR2 (I) location of  $i^{th}$  rocket on  
 body II in body II CS ( $x'_{IIi}$ ),  
 $(y'_{IIi}), (z'_{IIi})$ SUN1 the sum  $\Sigma \dot{I}_{xxIi}$ SUN2 the sum  $\dot{I}_{yyIi}$ SUN3 the sum  $\dot{I}_{zzIi}$ SAN1 the sum  $\dot{I}_{xxIIIi}$

SAN2	the sum $\sum \dot{I}_{yy_{IIi}}$	LDER	=0, no restart
SAN3	the sum $\sum \dot{I}_{zz_{IIi}}$		<0, restart to be made after end of step
XX10, YY10, ZZ10	initial values of moments of inertia, body I	ISP1	number of springs that have come off
XX20, YY20, ZZ20	initial values of moments of inertia, body II	ISS (1), ISS (2)	values controlling interchange of springs in constraint condition, in the case that the springs being used for constraint are not the last two to cease acting; if ISS (1) = ISS (2) = 0, no transfer required—if ISS (1) or ISS (2) is non-zero, transfer made by subroutine SWITCH

*Rockets, output*

XX1, YY1, ZZ1	computed values of moments of inertia, body I
XX2, YY2, ZZ2	computed values of moments of inertia, body II
FM1, FM2	computed values of mass ( $m_I$ ), ( $m_{II}$ )
R (J)	component of $\mathcal{Q}_j$ due to rocket forces ( $\mathcal{R}_j$ )

Triggers, rather than the variable LDER, are used to initiate restarts for the rocket forces.

*Hard-mounted springs, input*

WRP1 (1,I), WRP1 (2,I), WRP1 (3,I)	location of $i^{th}$ spring on body I in body I CS ( $x'_{ii}$ ), ( $y'_{ii}$ ), ( $z'_{ii}$ )
WRP2 (1,I), WRP2 (2,I), WRP2 (3,I)	location of $i^{th}$ spring on body II in body II CS ( $x'_{IIi}$ ), ( $y'_{IIi}$ ), ( $z'_{IIi}$ )
WRH (1,I), WRH (2,I), WRH (3,I)	direction cosines between spring $i$ and body II axes ( $\rho_{ix}$ ), ( $\rho_{iy}$ ), ( $\rho_{iz}$ )

SO (I), SK (I), SIOQ	initial force, spring constant, and residual force for $i^{th}$ spring (corrected for spring efficiency— $\eta^2 S_{io}$ , $\eta^2 k_i$ , $\eta^2 S_{if}$ )
----------------------	---

ISP	number of springs
N	restriction index

*Hard-mounted springs, output*

ICLAG	set to 1 when constraint goes off
S (J)	component of $\mathcal{Q}_j$ due to body II hard-mounted springs ( $\mathcal{S}_j$ )

*Universally-jointed springs, input*

ISU	number of springs
WO (I), UK (I), WF (I)	initial force, spring constant, and final force of spring $i$ (corrected for spring efficiency— $\eta^2 W_{io}$ , $\eta^2 k_i$ , $\eta^2 W_{if}$ )
XU1 (I), YU1 (I), ZU1 (I)	spring location on body I in body I CS ( $x'_{ii}$ ), ( $y'_{ii}$ ), ( $z'_{ii}$ )
XU2 (I), YU2 (I), ZU2 (I)	spring location on body II in body II CS ( $x'_{IIi}$ ), ( $y'_{IIi}$ ), ( $z'_{IIi}$ )

*Universally-jointed springs, output*

W (J)	component of $\mathcal{Q}_j$ due to universally-jointed springs ( $\mathcal{W}_j$ )
LDER	=0, no restart <0, restart to be made after end of step
ISU1	number of springs that have come off

c. **Matrix algebra subroutines.** To aid in these calculations, the following subroutines are used:

MULT1 (A,B,C,M1,M2,M3)	calculates $A^T B = C$ where A is $M1 \times M2$ , B is $M2 \times M3$
MULT2 (A,B,C,M1,M2,M3)	calculates $AB^T = C$ where A is $M1 \times M2$ , B is $M2 \times M3$
MULT3 (A,B,C,M1,M2,M3)	calculates $AB = C$ where A is $M1 \times M2$ , B is $M2 \times M3$

MCR (A,B,C,J)	forms the dot product of the $3 \times 1$ vector B with the $j^{th}$ row of the $3 \times 3$ matrix A and stores the result in C	MCROS (A,B,C)	forms $A \times B = C$ where A,B,C are dimensioned $3 \times 1$ ( $15 \times 15$ linear set for the constraint is solved by subroutine SOLVE <sup>2</sup> )
MCS (A,B,C,J)	forms the dot product of the $3 \times 1$ vector B with the $j^{th}$ column of the $3 \times 3$ matrix B and stores the result in C		
MADD (A,B,C,M1,M2)	forms $A + B = C$ with dimension $M1 \times M2$		
MSUB (A,B,C,M1,M2)	forms $A - B = C$ with dimension $M1 \times M2$		
MSCAL (A,B,C)	forms $AB = C$ where A is $1 \times 1$ , B is $3 \times 1$		

### C. Plotting Link

All of the values that can be plotted are written on tape B1. At the beginning of the plotting link, plot indicators are written into the array LOT. If variable I is to be plotted, LOT (I) is nonzero.

<sup>2</sup>Moler, C. B., *Numerical Matrix Inversion With Iterative Improvement*, Technical Report No. 32-394, Jet Propulsion Laboratory, Pasadena, California, April 15, 1963.

## X. INPUT DESCRIPTION AND FORMAT

The input format is given in the form of a series of tables, some of which may be omitted, depending on whether or not the corresponding type of force is to act. A complete list of input symbols and dimensions is collected here for reference.

### A. Input List With Dimensions

#### 1. General Inertial and Geometrical Characteristics

$I_{xxI}, I_{xyI}, \dots, I_{zzII}$	elements of inertia matrixes in the drawing board CS: lbm-in. <sup>2</sup>
$i_A$	transformation matrix indicator: =1, $A_I, A_{II}$ printed; =0, $A_I, A_{II}$ not printed
$m_I, m_{II}$	masses: lbm
$\Delta t$	initial integration interval: sec
$t_{PR}$	printout interval: sec
$t_0$	time at which program begins: sec
$\epsilon''_{Ix}, \dots, \epsilon''_{Iz}$	coordinates in the drawing board CS of the CM of bodies I and II: in.
$\omega''_x, \omega''_y, \omega''_z$	rates about drawing board axes just before separation: deg/sec

$\omega_{Iy'0}$	spinup roll of body I relative to body II: deg/sec
<b>2. Forces</b>	
$i_{CD}$	coulomb drag force indicator, number of drag forces present: up to 8
$i_{PY}$	pyrotechnic force indicator, number of pyrotechnic devices present: up to 3
$i_{CG}$	cold-gas jet indicator, number of cold-gas jets: up to 8
$i_{PN}$	pneumatics indicator, number of pneumatic pistons: up to 8
$i_{RK}$	rockets indicator, number of rockets: up to 8
$i_{SP}$	spring indicator, number of hard-mounted springs: up to 8
$i_{SU}$	universally-jointed spring indicator, number of springs: up to 8
$i_{CN}$	constraint index: if =0, no constraint; if =1, pin-puller constraint is present

**a. Coulomb drag**

$D_i$	magnitude of $i^{th}$ drag force: lbf
$d_{ii}$	separation distance beyond which $i^{th}$ drag force ceases: in.
$x_i'', y_i'', z_i''$	drawing board locations of $i^{th}$ drag force: in.

**b. Pyrotechnics**

$I_i$	total impulse of $i^{th}$ device: lbf-sec
$t_i$	firing time of $i^{th}$ device: sec (program requires that $t_1 \leq t_2 \leq t_3$ )
$x_i'', y_i'', z_i''$	pyrotechnic locations: in.
$\mu'_{ix}, \mu'_{iy}, \mu'_{iz}$	cosines of the acute angles between the drawing board axes and the $i^{th}$ device, except that $\mu'_{iy}$ is negative

**c. Cold-gas jets**

$f_{i1}, f_{i2}, f_3$	constants for jet $i$ depending on initial conditions, nozzle geometry, and properties of working fluid: lbf, 1/sec, 1
$J_{ST}$	value of jet force below which $J_i$ may be considered zero: lbf
$t_{i1}$	time at which $i^{th}$ jet turns on: sec
$t_{i2}$	time at which $i^{th}$ jet cuts off: sec
$x_i'', y_i'', z_i''$	cold-gas jet locations: in.
$\mu_{ix}, \mu_{iy}, \mu_{iz}$	cosines of angles between thrust vector for jet $i$ and body I axes
$\mu'_{ix}, \mu'_{iy}, \mu'_{iz}$	cosines of angles between thrust vector for jet $i$ and body II axes

**d. Pneumatics**

$A_i$	area of $i^{th}$ piston face: in. <sup>2</sup>

***B. Input Format***

Input data takes the form of a data card deck. To simplify input procedure, only three types of card format are used (with the exception of the first two cards).

For format type 1, the FORTRAN code is 6I12. These cards will contain up to six numbers per card, and each number is allotted 12 columns. The numbers must be integers (without a decimal point) and right adjusted.

For format type 2, the FORTRAN code is 6E12.8. These cards also will contain up to six numbers per card, with each number allotted 12 columns. These numbers are not integers (must have a decimal point), need not be right adjusted, and may have an exponent.

For format type 3, the FORTRAN code is 14I5. These cards are similar to those of format type 1, except that each number is allotted only 5 columns.

The input arrays for each group of input data are given in Tables 2 through 12. Each group is to be ordered as

given in its corresponding table, and the groups are to be stacked according to the order of the tables. Table 2 gives the mass, geometry, and indicator input, and Tables 3 through 9 give the force inputs. If a particular force is not to act (i.e., its indicator number is zero) its table and corresponding cards are to be omitted. Table 10 gives the pin-puller constraint input. Table 11 gives the plotting directions and completes the input, and Table 12 defines the plot indicators.

## XI. OUTPUT DESCRIPTION AND FORMAT

Program output consists of the generalized coordinates, velocities and useful auxiliary quantities. A listing of all output quantities and dimensions is given below.

### A. Output List with Dimensions

$d_s$	separation distance = $[(x_I - x_{II})^2 + (y_I - y_{II})^2 + (z_I - z_{II})^2]^{1/2}$ : in.
$t$	time: sec
$v_s$	separation velocity = $[(\dot{x}_I - \dot{x}_{II})^2 + (\dot{y}_I - \dot{y}_{II})^2 + (\dot{z}_I - \dot{z}_{II})^2]^{1/2}$ : in./sec
$v_I$	speed of CM: in./sec
$x_I, y_I, z_I$	inertial coordinates: in.
$\dot{x}_I, \dot{y}_I, \dot{z}_I$	inertial components of velocity of CM: in./sec

$\theta_I, \phi_I, \psi_I$	Eulerian angles: deg
$\dot{\theta}_I, \dot{\phi}_I, \dot{\psi}_I$	rates of change of Eulerian angles: deg/sec
$\omega_{x''I}, \omega_{y''I}, \omega_{z''I}$	rotation rates about drawing board axes: deg/sec
$\omega_I$	rotation rate about instantaneous axis: deg/sec
$\omega_{PYI}$	magnitude of vector sum of pitch and yaw rates: deg/sec

All of the output listed for body I also applies for body II.

### B. Output Format

All quantities in the output are self-explanatory; the format is illustrated in the sample problem of Section XIII.

## XII. ERROR DIAGNOSIS AND CHECKOUT

Because of the flexibility of the program, there are few error diagnoses that can be made internally. Should an error occur within the integration routine FMARK, the statement "ERROR OCCURS IN FMARK" is printed. Should the  $(12 \times 12)$  or  $(15 \times 15)$  matrix currently being inverted to solve for the generalized accelerations become singular, an appropriate statement is printed.

## XIII. SAMPLE PROBLEM

The purpose of the sample problem is to illustrate the operational use of the computer program. For this reason, the system has been presented in idealized form.

### A. Problem Statement

A capsule is to be separated from a spacecraft by means of four springs hard mounted on the spacecraft. The spring tips are constrained not to slip on their bearing surfaces. After separation, the capsule is spun up by means of 3 cold-gas jets. Subsequent to spinup, a retro-rocket is fired. The properties of the bodies and the force mechanisms are as follows (see Fig. 7):

#### *Spacecraft, body II*

$$m = 1000 \text{ lbm}$$

$$I_{xx} = 200 \text{ slug}\cdot\text{ft}^2$$

$$I_{yy} = 205 \text{ slug}\cdot\text{ft}^2$$

$$I_{zz} = 100 \text{ slug}\cdot\text{ft}^2$$

$$I_{xy} = I_{xz} = I_{yz} = 0$$

#### *Capsule, body I*

$$m = 1800 \text{ lbm}$$

$$I_{xx} = I_{yy} = 250 \text{ slug}\cdot\text{ft}^2$$

$$I_{zz} = 100 \text{ slug}\cdot\text{ft}^2$$

$$I_{xy} = I_{xz} = I_{yz} = 0$$

#### *Rocket motor*

$$\text{Thrust} = 100 \text{ lbf (constant)}$$

$$\text{Starting time} = \text{separation} + 10 \text{ sec}$$

$$\text{Duration} = 5 \text{ sec}$$

#### *Springs*

$$k_1 = k_2 = k_3 = 100 \text{ lbf/in.}$$

$$k_4 = 80 \text{ lbf/in.}$$

$$\text{Initial compression} = 4 \text{ in.}$$

$$\text{Final force} = 0$$

The springs are parallel to the  $z''$  axis; they have 100% efficiency. Initial angular velocities are zero.

#### *Gas jets*

Each nozzle has its own reservoir and is well insulated. From Eqs. (82) through (84), the properties of the nozzles and the working fluid yield the force law

$$J_i = \frac{50}{(1+t)^{1.5}} , \quad i = 1, 2, 3$$

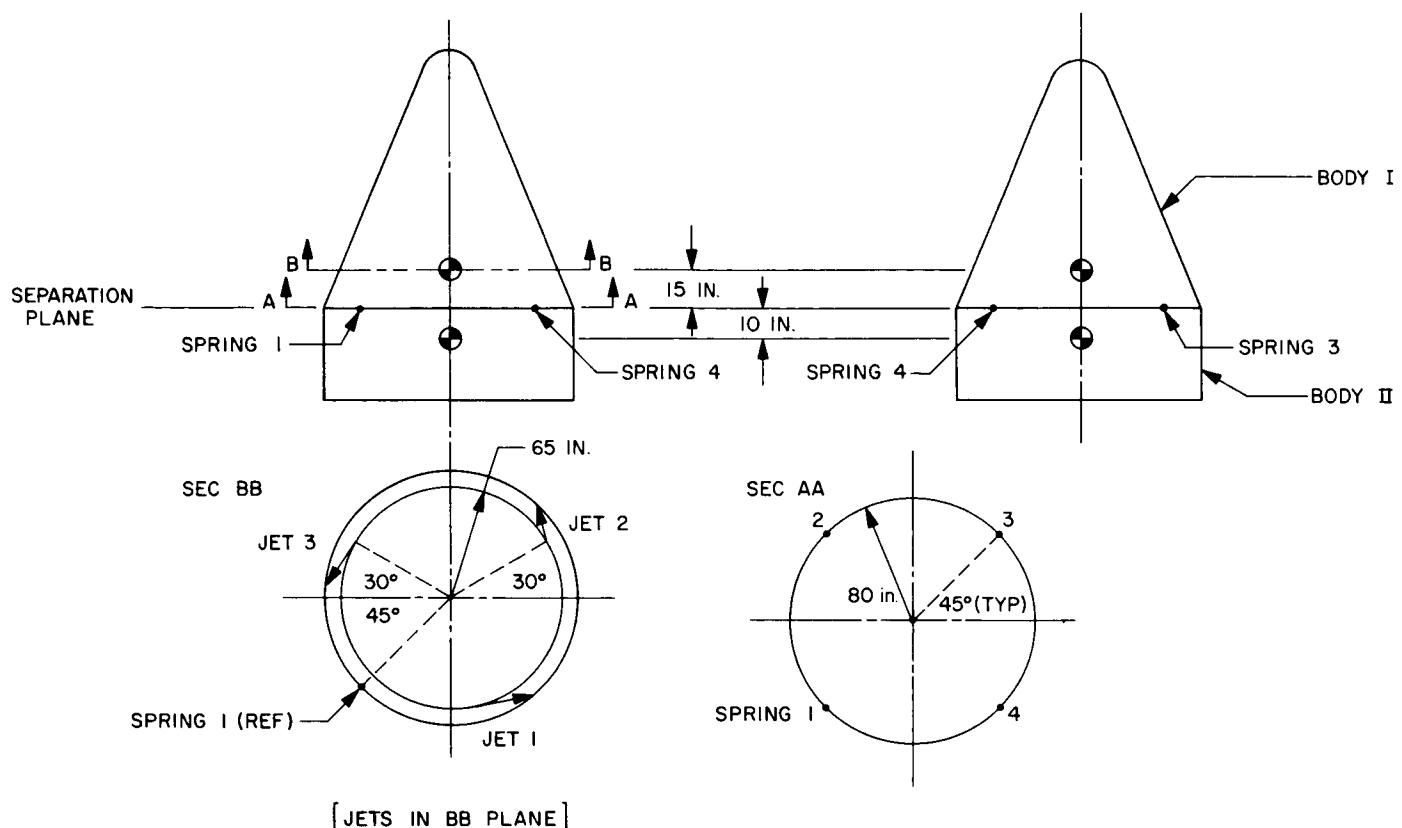

The jets are to fire at separation +2 sec and continue for 5 sec.

### B. Choice of the Drawing Board CS

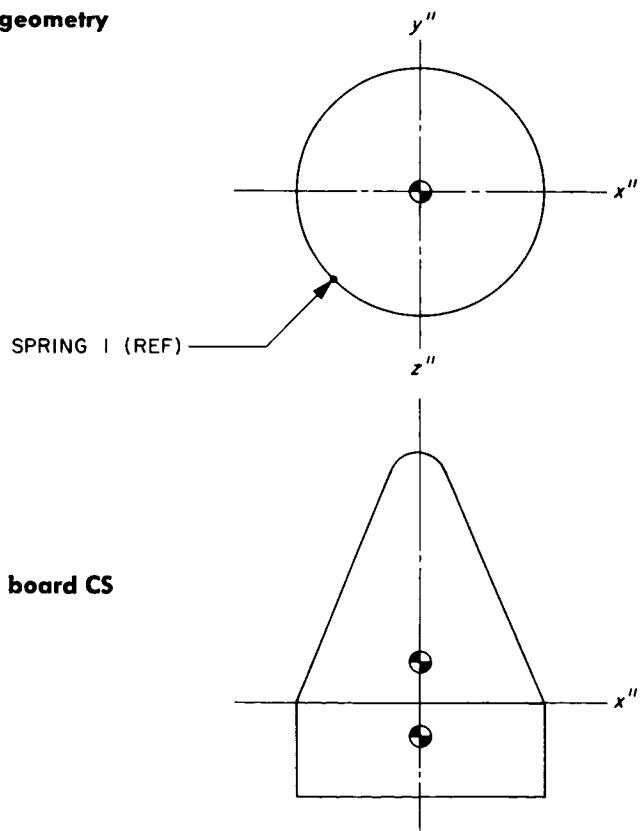

Since the hard mounted spring constraint is present, the  $z''$  axis must be chosen perpendicular to the separation plane (see Fig. 8).

### C. Output

The computer printout for the sample problem is presented in Appendix N, pp. N-79-N-84. Because of the length of the complete printout, only a few typical output data sets are shown.

**Fig. 7. Problem geometry**

**Fig. 8. Selection of drawing board CS**

## APPENDIX A

### Eulerian Angles and Vector Component Transformations

To use the Lagrange equations it is necessary to define three independent parameters that specify the orientation of each body. A common choice for these parameters is the set of Eulerian angles. There is not complete uniformity in the definitions of the Eulerian angles; the definitions used in this report are those of Goldstein.<sup>1</sup>

#### A. Symbols

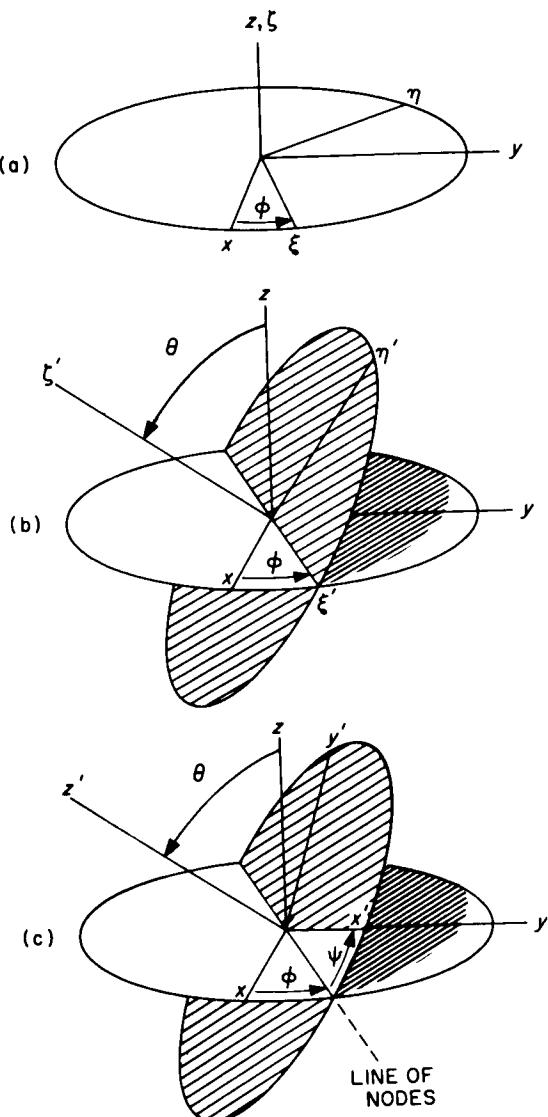

<b>A, B, C, D</b>	rotation matrixes used in describing Eulerian angle generation
<b>A<sup>-1</sup>, B<sup>-1</sup>, C<sup>-1</sup>, D<sup>-1</sup></b>	inverse of the <b>A, B, C, D</b> matrixes
$a_{ij}$	elements of the $A_I$ matrix ( $i^{th}$ row, $j^{th}$ column)
$b_{ij}$	elements of the $A_{II}$ matrix ( $i^{th}$ row, $j^{th}$ column)
$c_{ij}$	elements of the $A_I$ or $A_{II}$ matrix ( $i^{th}$ row, $j^{th}$ column)
$\mathbf{r}_i$	location vector of the point whose index is $i$
$\mathbf{v}_a$	a vector in the $xyz$ CS
$v_x, v_y, v_z$	components of the $\mathbf{v}_a$ in the $xyz$ CS
$\mathbf{v}_{a'}$	a vector in the $x'y'z'$ CS
$v_{x'}, v_{y'}, v_{z'}$	components of $\mathbf{v}_{a'}$ in the $x'y'z'$ CS
$\mathbf{v}_\alpha$	a vector in the $\xi\eta\zeta$ CS
$v_\xi, v_\eta, v_\zeta$	components of $\mathbf{v}_\alpha$ in the $\xi\eta\zeta$ CS
$\mathbf{v}_{\alpha'}$	a vector in the $\xi'\eta'\zeta'$ CS
$v_{\xi'}, v_{\eta'}, v_{\zeta'}$	components of $\mathbf{v}_{\alpha'}$ in the $\xi'\eta'\zeta'$ CS
$x, y, z$	the inertial CS
$x', y', z'$	the body-fixed CS
$\xi, \eta, \zeta$	an intermediate CS used in the definition of the Eulerian angles
$\xi', \eta', \zeta'$	another intermediate CS used in the definition of the Eulerian angles

#### B. Generation of Eulerian Angles

First, the  $x, y, z$  system (in which a vector is denoted  $\mathbf{v}_a$  with components  $v_x, v_y, v_z$ ) is rotated by an angle  $\phi$ ,

counterclockwise, about the  $z$  axis (Fig. A-1a). The resultant CS is the  $\xi\eta\zeta$  system; a vector in these coordinates is denoted  $\mathbf{v}_\alpha$  with components  $v_\xi, v_\eta, v_\zeta$ .

Second, the intermediate axes,  $\xi\eta\zeta$ , are rotated about the  $\xi$  axis, counterclockwise, by the angle  $\theta$  to produce the  $\xi'\eta'\zeta'$  axes (see Fig. A-1b). A vector in this CS, denoted  $\mathbf{v}_{\alpha'}$ , has components  $v_{\xi'}, v_{\eta'}, v_{\zeta'}$ . The  $\xi'$  axis also is known as the line of nodes.

**Fig. A-1. Generation of Eulerian angles**

<sup>1</sup>Goldstein, H., *Classical Mechanics*, Addison-Wesley Publishing Company, Inc., Reading, Massachusetts, 1959, pp. 107-109.

Third, the  $\xi'\eta'\zeta'$  axes are rotated counterclockwise by an angle  $\psi$  about the  $\zeta'$  axis to produce the  $x'y'z'$  system of axes (see Fig. A-1c). The  $x'y'z'$  system is the body-

fixed system, and the  $xyz$  system is the space-fixed (or inertial) CS. A vector in the  $x'y'z'$  system is denoted  $\mathbf{v}_{a'}$  with components  $v_{x'}, v_{y'}, v_{z'}$ .

### C. Vector Component Transformations

The elements of the complete rotation matrix  $\mathbf{A}$  can be obtained by writing the matrix as the product of the separate rotation matrixes.

Thus

$$\mathbf{v}_a = \mathbf{D} \mathbf{v}_a \quad \text{where} \quad \mathbf{D} = \begin{bmatrix} c\phi & s\phi & 0 \\ -s\phi & c\phi & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad (\text{A-1})$$

$$\mathbf{v}_{a'} = \mathbf{C} \mathbf{v}_a \quad \text{where} \quad \mathbf{C} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & c\theta & s\theta \\ 0 & -s\theta & c\theta \end{bmatrix} \quad (\text{A-2})$$

$$\mathbf{v}_{a'} = \mathbf{B} \mathbf{v}_{a'} \quad \text{where} \quad \mathbf{B} = \begin{bmatrix} c\psi & s\psi & 0 \\ -s\psi & c\psi & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad (\text{A-3})$$

$$\mathbf{v}_{a'} = \mathbf{BCD} \mathbf{v}_a = \mathbf{A} \mathbf{v}_a \quad \text{where} \quad \mathbf{A} = \mathbf{BCD} \quad (\text{A-4})$$

$$\mathbf{A} = \begin{bmatrix} c\phi c\psi - c\theta s\phi s\psi & s\phi c\psi + c\theta c\phi s\psi & s\theta s\psi \\ -c\phi s\psi - c\theta s\phi c\psi & -s\phi s\psi + c\theta c\phi c\psi & s\theta c\psi \\ s\theta s\phi & -s\theta c\phi & c\theta \end{bmatrix} \quad (\text{A-5})$$

For simplicity of notation, the elements of the  $\mathbf{A}_I$  and  $\mathbf{A}_{II}$  matrixes are denoted  $a_{ij}$  and  $b_{ij}$ , respectively. The elements of a nonspecific  $\mathbf{A}$  matrix are denoted  $c_{ij}$ .

The inverse transformation is

$$\mathbf{v}_a = \mathbf{A}^{-1} \mathbf{v}_{a'} \quad (\text{A-6})$$

Since the  $\mathbf{BCD}$  matrixes are orthogonal, their product,  $\mathbf{A}$ , is orthogonal, and the inverse of  $\mathbf{A}$  is its transpose.

$$\mathbf{A}_I^{-1} = \begin{bmatrix} a_{11} & a_{21} & a_{31} \\ a_{12} & a_{22} & a_{32} \\ a_{13} & a_{23} & a_{33} \end{bmatrix} \quad (\text{A-7})$$

$$\mathbf{A}_{II}^{-1} = \begin{bmatrix} b_{11} & b_{21} & b_{31} \\ b_{12} & b_{22} & b_{32} \\ b_{13} & b_{23} & b_{33} \end{bmatrix} \quad (\text{A-8})$$

The complete transformation for location vectors is

$$\mathbf{r}_i = \mathbf{r} + \mathbf{A}^{-1} \mathbf{r}'_i \quad (\text{A-9})$$

$$\mathbf{r}'_i = \mathbf{A} (\mathbf{r}_i - \mathbf{r}) \quad (\text{A-10})$$

## APPENDIX B

### Length of Extension of a Spring Hard-Mounted on Body II

To determine the length of extension of a hard-mounted spring on body II, it is necessary to define the bearing plane in the body I CS, express  $\bar{r}_i$  in the body I CS, and then solve for  $j_i$ .

#### A. Symbols

$\bar{r}_{IIi}$  location of the tip of spring  $i$  in body II CS

$T$  matrix product  $A_I A_{II}^T$

Because of the redefinition of the initial CS, the bearing plane is perpendicular to the  $y'_I$  axis, and  $r'_{IIi}$  is in the plane. The equation for the plane is

$$y'_I = y'_{IIi} \quad (B-1)$$

Clearly

$$\bar{r}_{IIi} = r'_{IIi} + j_i \rho_i$$

In the inertial CS

$$\bar{r}_{IIi} = r_{II} + A_{II}^T r'_{IIi} + j_i A_{II}^T \rho_i \quad (B-3)$$

In the body I CS

$$\bar{r}_i = A_I (r_{II} - r_i) + A_I A_{II}^T r'_{IIi} + j_i A_I A_{II}^T \rho_i \quad (B-4)$$

$$\bar{r}'_i = -A_I r + A_I A_{II}^T r'_{IIi} + j_i T^T \rho_i \quad (B-5)$$

where a substitution of  $T$  has been used selectively for later simplicity.

Now the constraint condition is that  $\bar{r}'_i$  must have its tip in the bearing plane. Thus

$$y'_I = -a_{(2)}^T r + a_{(2)}^T A_{II}^T r'_{IIi} + j_i t^{(2)T} \rho_i \quad (B-6)$$

and

$$j_i t^{(2)T} \rho_i = +y'_{IIi} + a_{(2)}^T r - a_{(2)}^T A_{II}^T r'_{IIi} \quad (B-7)$$

The left-hand side of the above equation is simply  $a_{(2)}^T \cdot d_i$  (see Coulomb Drag Section, Eq. 59). Thus

$$j_i = \frac{a_{(2)}^T \cdot d_i}{t^{(2)T} \cdot \rho_i} \quad (B-8)$$

## APPENDIX C

### Conversions Between Rates About Eulerian Axes and Rates About Body Axes

Since initial angular rates will normally be reported as body-axis angular rates, and since body-axis rates are often needed as the final result, conversions between Euler angle rates and body rates must be established.

#### A. Symbols

With the exception of those listed below, the symbols used in this appendix are the same as in Appendix A.

$\omega$  angular velocity

$\omega_\theta$  Eulerian  $\theta$  component of  $\omega$

$(\omega_\theta)_{x'}$  component along the body  $x'$  axis due to  $\omega_\theta$

$\omega_x'$  body  $x'$  component of  $\omega$

$E$  identity matrix

From the definition of  $(\omega_\theta)_{x'}$ , etc., there is

$$\omega_{x'} = (\omega_\theta)_{x'} + (\omega_\phi)_{x'} + (\omega_\psi)_{x'} \quad (C-1)$$

$$\omega_{y'} = (\omega_\theta)_{y'} + (\omega_\phi)_{y'} + (\omega_\psi)_{y'} \quad (C-2)$$

$$\omega_{z'} = (\omega_\theta)_{z'} + (\omega_\phi)_{z'} + (\omega_\psi)_{z'} \quad (C-3)$$

From geometry, it is evident that

$$\begin{bmatrix} (\omega_\phi)_{x'} \\ (\omega_\phi)_{y'} \\ (\omega_\phi)_{z'} \end{bmatrix} = A \begin{bmatrix} 0 \\ 0 \\ \dot{\phi} \end{bmatrix} \quad (C-4)$$

$$\begin{bmatrix} (\omega_\theta)_{x'} \\ (\omega_\theta)_{y'} \\ (\omega_\theta)_{z'} \end{bmatrix} = B \begin{bmatrix} \dot{\theta} \\ 0 \\ 0 \end{bmatrix} \quad (C-5)$$

$$\begin{bmatrix} (\omega_\psi)_{x'} \\ (\omega_\psi)_{y'} \\ (\omega_\psi)_{z'} \end{bmatrix} = \mathbf{E} \begin{bmatrix} 0 \\ 0 \\ \dot{\psi} \end{bmatrix} \quad (C-6)$$

Putting Eqs. (C-4), (C-5), (C-6) into Eqs. (C-1), (C-2), and (C-3) gives the components of  $\omega$  with respect to the body axes in terms of the rates about the Eulerian axes.

$$\omega_{x'} = \dot{\phi} \sin \theta \sin \psi + \dot{\theta} \cos \psi \quad (C-7)$$

$$\omega_{y'} = \dot{\phi} \sin \theta \cos \psi - \dot{\theta} \sin \psi \quad (C-8)$$

$$\omega_{z'} = \dot{\phi} \cos \theta + \dot{\psi} \quad (C-9)$$

The inverse transformations may be found by a linear inversion (such as the use of Cramer's rule) of Eqs. (C-7) through (C-9). The result of this inversion is

$$\dot{\theta} = \omega_{x'} \cos \psi - \omega_{y'} \sin \psi \quad (C-10)$$

$$\dot{\phi} = \frac{1}{\sin \theta} [\omega_{x'} \sin \psi + \omega_{y'} \cos \psi] \quad (C-11)$$

$$\dot{\psi} = \omega_{z'} - \frac{\cos \theta}{\sin \theta} [\omega_{x'} \sin \psi + \omega_{y'} \cos \psi] \quad (C-12)$$

## APPENDIX D

### Determination of Generalized Forces

The generalized forces are defined by means of a virtual work principle: the virtual work done by a force,  $\mathbf{f}$ , acting through a virtual displacement,  $\delta \mathbf{r}$ , is equal to the virtual work done by the generalized forces,  $\mathcal{Q}_k$ , acting through the corresponding virtual generalized displacements,  $\delta q_k$ . That is

$$\mathbf{f}^T (\delta \mathbf{r}) = \sum_k \mathcal{Q}_k \delta q_k \quad (D-1)$$

Consider some point  $i$  on body I and let this be the point of action for a force  $\mathbf{f}_i$ . In inertial coordinates

$$\mathbf{r}_i = \mathbf{r}_I + \mathbf{A}_I^T \mathbf{r}'_{ii}$$

and

$$\delta \mathbf{r}_i = \delta \mathbf{r}_I + \delta [\mathbf{A}_I^T \mathbf{r}'_{ii}] \quad (D-2)$$

$$\delta \mathbf{r}_i = \delta \mathbf{r}_I + \left[ \frac{\partial \mathbf{A}_I^T}{\partial \theta_I} \delta \theta_I + \frac{\partial \mathbf{A}_I^T}{\partial \phi_I} \delta \phi_I + \frac{\partial \mathbf{A}_I^T}{\partial \psi_I} \delta \psi_I \right] \mathbf{r}'_{ii} \quad (D-3)$$

$$\delta \mathbf{r}_i = \delta \mathbf{r}_I + \left[ \frac{\partial \mathbf{A}_I^T}{\partial \theta_I} \mathbf{A}_I \delta \theta_I + \frac{\partial \mathbf{A}_I^T}{\partial \phi_I} \mathbf{A}_I \delta \phi_I + \frac{\partial \mathbf{A}_I^T}{\partial \psi_I} \mathbf{A}_I \delta \psi_I \right] \mathbf{r}_{ii} \quad (D-4)$$

where  $\mathbf{r}_{ii}$  is  $\mathbf{r}'_{ii}$  expressed in the inertial CS.

Applying the virtual work principle

$$\sum_k \mathcal{Q}_k \delta q_k = \mathbf{f}_i^T \left\{ \left[ \frac{\partial \mathbf{A}_I^T}{\partial \theta_I} \mathbf{A}_I \delta \theta_I + \frac{\partial \mathbf{A}_I^T}{\partial \phi_I} \mathbf{A}_I \delta \phi_I + \frac{\partial \mathbf{A}_I^T}{\partial \psi_I} \mathbf{A}_I \delta \psi_I \right] \mathbf{r}_{ii} + \delta \mathbf{r}_I \right\} \quad (D-5)$$

Since the  $\delta q_k$  are independent, the generalized forces are

$$\mathcal{Q}_{xi} = f_{ix}, \mathcal{Q}_{yi} = f_{iy}, \mathcal{Q}_{zi} = f_{iz} \quad (D-6)$$

$$\mathcal{Q}_{\theta_1} = \mathbf{f}_i^T \frac{\partial \mathbf{A}_1^T}{\partial \theta_1} \mathbf{A}_1 \mathbf{r}_{1i} \quad (\text{D-7})$$

$$\mathcal{Q}_{\phi_1} = \mathbf{f}_i^T \frac{\partial \mathbf{A}_1^T}{\partial \phi_1} \mathbf{A}_1 \mathbf{r}_{1i} \quad (\text{D-8})$$

$$\mathcal{Q}_{\psi_1} = \mathbf{f}_i^T \frac{\partial \mathbf{A}_1^T}{\partial \psi_1} \mathbf{A}_1 \mathbf{r}_{1i} \quad (\text{D-9})$$

Equation (D-6) establishes the desired result for the linear coordinates. The remainder of this Appendix establishes the results for the angular coordinates.

It will now be shown that the matrix product  $\mathbf{A}^T \dot{\mathbf{A}}$  is skew symmetric. Since  $\mathbf{A}_1$  is orthogonal

$$\mathbf{a}^{(i)T} \mathbf{a}^{(j)} = \delta_{ij} \quad (\text{D-10})$$

Let  $\mathbf{H} = \mathbf{A}_1^T \dot{\mathbf{A}}_1$ , with elements  $h_{ij}$

Then

$$h_{ij} = \mathbf{a}^{(i)T} \dot{\mathbf{a}}^{(j)} \quad (\text{D-11})$$

$$h_{ij} + h_{ji} = \mathbf{a}^{(i)T} \dot{\mathbf{a}}^{(j)} + \mathbf{a}^{(j)T} \dot{\mathbf{a}}^{(i)}$$

$$h_{ij} + h_{ji} = \mathbf{a}^{(i)T} \dot{\mathbf{a}}^{(j)} + \dot{\mathbf{a}}^{(i)T} \mathbf{a}^{(j)} = \frac{d}{dt} [\mathbf{a}^{(i)T} \mathbf{a}^{(j)}] = \frac{d}{dt} [\delta_{ij}] = 0$$

and

$$h_{ij} = -h_{ji} \quad (\text{D-12})$$

It may be easily verified that the product of a skew-symmetric matrix and a column matrix is equivalent to the vector cross product of two corresponding vectors

$$\boldsymbol{\omega} \times \mathbf{r} = \mathbf{L}\mathbf{r}$$

where

$$\mathbf{L} = \begin{bmatrix} 0 & -\omega_3 & \omega_2 \\ \omega_3 & 0 & -\omega_1 \\ -\omega_2 & \omega_1 & 0 \end{bmatrix}, \quad \boldsymbol{\omega} = \begin{bmatrix} \omega_1 \\ \omega_2 \\ \omega_3 \end{bmatrix} \quad (\text{D-13})$$

Now consider two coordinate systems,  $\Sigma_1(x_1, x_2, x_3)$  and  $\Sigma_2(y_1, y_2, y_3)$ .  $\mathbf{D}$  is the transformation matrix from  $\Sigma_2$  to  $\Sigma_1$ . Then, for a vector  $\mathbf{r}$

$$\mathbf{r}_1 = \mathbf{D} \mathbf{r}_2 \quad (\text{D-14})$$

$$\dot{\mathbf{r}}_1 = \mathbf{D} \dot{\mathbf{r}}_2 + \dot{\mathbf{D}} \mathbf{r}_2 = \mathbf{D} [\dot{\mathbf{r}}_2 + \mathbf{D}^T \dot{\mathbf{D}} \mathbf{r}_2] \quad (\text{D-15})$$

where the subscript on  $\mathbf{r}$  indicates the coordinate system in which it is expressed. By analogy to elementary kinematics, we have

$$\mathbf{D}^T \dot{\mathbf{D}} \mathbf{r}_2 = \boldsymbol{\omega} \times \mathbf{r}_2$$

where

$$\boldsymbol{\omega} = \begin{bmatrix} \omega_{y1} \\ \omega_{y2} \\ \omega_{y3} \end{bmatrix} \quad (\text{D-16})$$

is the angular velocity of  $\Sigma_2$  relative to  $\Sigma_1$  expressed in  $\Sigma_2$ .

Since  $\mathbf{A}_I$  is the transformation from the inertial CS to the body I-fixed CS, it is clear, from the above discussion, that

$$\mathbf{A}_I^T \dot{\mathbf{A}}_I = \begin{bmatrix} 0 & -\omega_z & \omega_y \\ \omega_z & 0 & -\omega_x \\ -\omega_y & \omega_x & 0 \end{bmatrix}$$

where

$$\boldsymbol{\omega} = \begin{bmatrix} \omega_x \\ \omega_y \\ \omega_z \end{bmatrix} \quad (\text{D-17})$$

is the angular velocity of the inertial CS relative to the body I CS, expressed in the inertial CS.

Then

$$\dot{\mathbf{A}}_I^T \mathbf{A}_I = \begin{bmatrix} 0 & \omega_z & -\omega_y \\ -\omega_z & 0 & \omega_x \\ \omega_y & -\omega_x & 0 \end{bmatrix} \quad (\text{D-18})$$

By the total derivative rule

$$\dot{\mathbf{A}}_I^T \mathbf{A}_I = \left[ \frac{\partial \mathbf{A}_I^T}{\partial \theta} \dot{\theta} + \frac{\partial \mathbf{A}_I^T}{\partial \phi} \dot{\phi} + \frac{\partial \mathbf{A}_I^T}{\partial \psi} \dot{\psi} \right] \mathbf{A}_I \quad (\text{D-19})$$

Let

$$\mathbf{B}_\theta \equiv [b_{\theta i j}] = \frac{\partial \mathbf{A}_I^T}{\partial \theta} \mathbf{A}_I, \mathbf{B}_\phi \equiv [b_{\phi i j}] = \frac{\partial \mathbf{A}_I^T}{\partial \phi} \mathbf{A}_I, \mathbf{B}_\psi \equiv [b_{\psi i j}] = \frac{\partial \mathbf{A}_I^T}{\partial \psi} \mathbf{A}_I$$

By considering equality for the (2, 3) elements in (D-19), we obtain

$$\omega_x = b_{\theta 23} \dot{\theta} + b_{\phi 23} \dot{\phi} + b_{\psi 23} \dot{\psi} \quad (\text{D-20})$$

but from vector addition

$$\omega_x = (-e_{\theta x}) \dot{\theta} + (-e_{\phi x}) \dot{\phi} + (-e_{\psi x}) \dot{\psi} \quad (\text{D-21})$$

where

$$\mathbf{e}_\theta = \begin{bmatrix} e_{\theta x} \\ e_{\theta y} \\ e_{\theta z} \end{bmatrix}, \quad \mathbf{e}_\phi = \begin{bmatrix} e_{\phi x} \\ e_{\phi y} \\ e_{\phi z} \end{bmatrix}, \quad \mathbf{e}_\psi = \begin{bmatrix} e_{\psi x} \\ e_{\psi y} \\ e_{\psi z} \end{bmatrix}$$

are the unit vectors along the positive rotation axes for  $\theta, \phi, \psi$  when the inertial CS is considered fixed.

Now, since  $\dot{\theta}, \dot{\phi}$ , and  $\dot{\psi}$  are independent, Eqs. (D-20) and (D-21) yield

$$b_{\theta 23} = -e_{\theta x} \quad b_{\phi 23} = -e_{\phi x} \quad b_{\psi 23} = -e_{\psi x} \quad (\text{D-22})$$

By writing equations similar to (D-20) and (D-21) for  $\omega_y$  and  $\omega_z$ , it can be shown that

$$\mathbf{B}_\theta = \begin{bmatrix} 0 & -e_{\theta z} & e_{\theta y} \\ e_{\theta z} & 0 & -e_{\theta x} \\ -e_{\theta y} & e_{\theta x} & 0 \end{bmatrix}, \quad \mathbf{B}_\phi = \begin{bmatrix} 0 & -e_{\phi z} & e_{\phi y} \\ e_{\phi z} & 0 & -e_{\phi x} \\ -e_{\phi y} & e_{\phi x} & 0 \end{bmatrix}, \quad \mathbf{B}_\psi = \begin{bmatrix} 0 & -e_{\psi z} & e_{\psi y} \\ e_{\psi z} & 0 & -e_{\psi x} \\ -e_{\psi y} & e_{\psi x} & 0 \end{bmatrix} \quad (\text{D-23})$$

Equation (D-23) into (D-7) gives

$$\mathcal{Q}_{\theta i} = \mathbf{f}_i^T \mathbf{B}_\theta \mathbf{r}_{1i} \quad (\text{D-24})$$

Application of Eqs. (D-13) through (D-24) gives

$$\begin{aligned}
 Q_{\theta I} &= \mathbf{f}_i \cdot (\mathbf{e}_\theta \times \mathbf{r}_{Ii}) \\
 Q_{\theta I} &= -\mathbf{f}_i \cdot (\mathbf{r}_{Ii} \times \mathbf{e}_\theta) = -(\mathbf{r}_{Ii} \times \mathbf{e}_\theta) \cdot \mathbf{f}_i \\
 Q_{\theta I} &= (\mathbf{r}_{Ii} \times \mathbf{f}_i) \cdot \mathbf{e}_{\theta I} \\
 Q_{\theta I} &= (\text{torque vector}) \cdot \mathbf{e}_\theta \\
 Q_{\theta I} &= \text{component of torque along } \mathbf{e}_\theta
 \end{aligned} \tag{D-25}$$

Similarly

$$Q_{\phi I} = \text{component of torque along } \mathbf{e}_\phi \tag{D-26}$$

$$Q_{\psi I} = \text{component of torque along } \mathbf{e}_\psi \tag{D-27}$$

It is valid to sum over  $i$  in Eqs. (D-25) and (D-6) to obtain the generalized forces for many  $\mathbf{f}_k$ . This analysis also applies to body II.

## APPENDIX E

### Velocity of Separation Between a Point on Body I and a Point on Body II

The velocity of separation between initially coincident points on body I and body II is required in order to compute the directions of coulomb drag forces. By definition

$$\mathbf{v}_i = \frac{d(\mathbf{d}_i)}{dt} \tag{E-1}$$

$$\mathbf{v}_i = \dot{\mathbf{r}} + \dot{\mathbf{A}}_I^T \mathbf{r}'_{Ii} - \dot{\mathbf{A}}_{II}^T \mathbf{r}'_{IIi} \tag{E-2}$$

The time derivatives of the elements of the  $\mathbf{A}$  matrixes are

$$c_{11} = (-c\theta s\phi s\psi + c\phi c\psi) \tag{E-3}$$

$$\dot{c}_{11} = (s\theta s\phi s\psi) \dot{\theta} - \dot{c}_{12} \dot{\phi} + c_{21} \dot{\psi} \tag{E-4}$$

$$c_{12} = (c\theta c\phi s\psi + s\phi c\psi) \tag{E-5}$$

$$\dot{c}_{12} = -(s\theta c\phi s\psi) \dot{\theta} + \dot{c}_{11} \dot{\phi} + c_{22} \dot{\psi} \tag{E-6}$$

$$c_{13} = (s\theta c\psi) \tag{E-7}$$

$$\dot{c}_{13} = (c\theta s\psi) \dot{\theta} + c_{23} \dot{\psi} \tag{E-8}$$

$$c_{21} = (-c\theta s\phi c\psi - c\phi s\psi) \tag{E-9}$$

$$\dot{c}_{21} = (s\theta s\phi c\psi) \dot{\theta} - c_{22} \dot{\phi} - c_{11} \dot{\psi} \tag{E-10}$$

$$c_{22} = (c\theta c\phi c\psi - s\phi s\psi) \tag{E-11}$$

$$\dot{c}_{22} = -(s\theta c\phi c\psi) \dot{\theta} + c_{21} \dot{\phi} - c_{12} \dot{\psi} \tag{E-12}$$

$$c_{23} = (s\theta c\psi) \tag{E-13}$$

$$\dot{c}_{23} = (c\theta c\psi) \dot{\theta} - c_{13} \dot{\psi} \quad (\text{E-14})$$

$$c_{31} = (s\theta s\phi) \quad (\text{E-15})$$

$$\dot{c}_{31} = (c\theta s\phi) \dot{\theta} - c_{32} \dot{\phi} \quad (\text{E-16})$$

$$c_{32} = -(s\theta c\phi) \quad (\text{E-17})$$

$$\dot{c}_{32} = -(c\theta c\phi) \dot{\theta} + c_{31} \dot{\phi} \quad (\text{E-18})$$

$$c_{33} = c\theta \quad (\text{E-19})$$

$$\dot{c}_{33} = -(s\theta) \dot{\theta} \quad (\text{E-20})$$

## APPENDIX F

### Derivation of Force vs Time Relation for an Adiabatic Compressed Gas Jet

The classical ideal gas relations are utilized to determine the force-time relation for the cold gas-jet model (Fig. F-1).

#### A. Symbols

<i>A</i>	area
<i>a</i>	speed of sound
<i>C</i> <sub>1</sub> , <i>C</i> <sub>2</sub> , <i>C</i> <sub>3</sub>	constants depending on working fluid properties and/or nozzle geometry
<i>F</i>	thrust
<i>M</i>	mach number
<i>m</i>	mass of gas in tank
<i>ṁ</i>	mass flow rate
<i>p</i>	static pressure
<i>p'</i>	external static pressure
<i>R</i>	gas constant
<i>T</i>	absolute temperature
<i>u</i>	velocity
<i>V</i>	volume upstream of throat
<i>α</i>	nozzle divergence half-angle
<i>γ</i>	ratio of specific heats for working fluid
<i>λ</i>	nozzle divergence correction factor, $\frac{1}{2}(1 + \cos \alpha)$
<i>ρ</i>	density
<i>τ</i>	time
0 (subscript)	initial condition

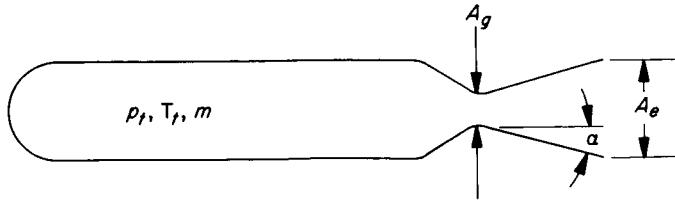

Fig. F-1. Compressed gas jet

## B. Derivation

$$F = -\lambda u_e \dot{m} + (p_e - p') A_e \quad (\text{F-1})$$

Assuming a perfect gas and an adiabatic, isentropic process

$$\dot{m} = \rho_g u_g A_g \quad (\text{F-2})$$

$$a = (\gamma R T)^{1/2} \quad (\text{F-3})$$

$$\rho = \rho_t \left( 1 + \frac{\gamma - 1}{2} M^2 \right)^{-1/(\gamma-1)} \quad (\text{F-4})$$

$$\frac{u}{a_t} = M \left( 1 + \frac{\gamma - 1}{2} M^2 \right)^{-1/2} \quad (\text{F-5})$$

$$p = \rho R T \quad (\text{F-6})$$

$$\rho_g = \rho_t \left( \frac{2}{\gamma + 1} \right)^{1/(\gamma-1)} = \frac{p_t}{R T_t} \left( \frac{2}{\gamma + 1} \right)^{-1/(\gamma-1)} \quad (\text{F-7})$$

$$u_g = a_t \left( \frac{2}{\gamma + 1} \right)^{1/2} = \left( \frac{2}{\gamma + 1} \right)^{1/2} (\gamma R T_t)^{1/2} \quad (\text{F-8})$$

$$\dot{m} = - \left( \frac{2}{\gamma + 1} \right)^{(\gamma+1)/2(\gamma-1)} \left( \frac{\gamma}{R T_t} \right)^{1/2} p_t A_g \equiv C_1 \frac{p_t}{(T_t)^{1/2}} \quad (\text{F-9})$$

$$u_e = M_e \left( 1 + \frac{\gamma - 1}{2} M_e^2 \right)^{-1/2} (\gamma R T_t)^{1/2} \equiv C_2 (T_t)^{1/2} \quad (\text{F-10})$$

$M_e$  is implicitly determined by

$$\frac{A_g}{A_e} = \left( \frac{\gamma + 1}{2} \right)^{(\gamma+1)/[2(\gamma-1)]} M_e \left( 1 + \frac{\gamma - 1}{2} M_e^2 \right)^{-[(\gamma+1)/2(\gamma-1)]} \quad (\text{F-11})$$

$$p_e = C_3 p_t$$

where

$$C_3 \equiv \left( 1 + \frac{\gamma - 1}{2} M_e^2 \right)^{-[\gamma/(\gamma-1)]} \quad (\text{F-12})$$

$$F = -\lambda C_1 C_2 p_t + A_e C_3 p_t - A_e p' = (\lambda C_1 C_2 + A_e C_3) p_t - A_e p' \quad (\text{F-13})$$

$$\dot{m} = \rho_t V = \frac{V p_t}{R T_t} \quad (\text{F-14})$$

Now

$$T_t = \left( \frac{p_t}{p_{t_0}} \right)^{(\gamma-1)/\gamma} T_{t_0} \quad (\text{F-15})$$

so

$$m = \frac{V p_t}{R T_{t_0} \left( \frac{p_t}{p_{t_0}} \right)^{(\gamma-1)/\gamma}} = \frac{V (p_{t_0})^{(\gamma-1)/\gamma}}{R T_{t_0}} p_t^{1/\gamma} \quad (\text{F-16})$$

$$\dot{m} = C_1 p_t \left( \frac{p_t}{p_{t_0}} \right)^{-[(\gamma-1)/2\gamma]} T_{t_0}^{-1/2} = C_1 \left( \frac{p_{t_0}^{(\gamma-1)/\gamma}}{T_{t_0}} \right)^{1/2} p_t^{(\gamma+1)/2\gamma} \quad (\text{F-17})$$

Using Eqs. (F-15) and (F-16) to eliminate  $p_t$  from Eq. (F-17) gives

$$\dot{m} = C_1 \frac{\left( \frac{p_{t_0}^{(\gamma-1)/\gamma}}{T_{t_0}} \right)^{1/2} p_t^{(\gamma+1)/2\gamma}}{\left[ \frac{V (p_{t_0})^{(\gamma-1)/\gamma}}{R T_{t_0}} p_t^{1/\gamma} \right]^{(\gamma+1)/2}} m^{(\gamma+1)/2} \quad (\text{F-18})$$

$$\dot{m} = C_1 \left( \frac{R}{V} \right)^{(\gamma+1)/2} \left( \frac{p_{t_0}^{(\gamma-1)/\gamma}}{T_{t_0}} \right)^{-(\gamma/2)} m^{(\gamma+1)/2} \quad (\text{F-19})$$

$$m = \left[ m_0^{-[(\gamma-1)/2]} - C_1 \left( \frac{\gamma-1}{2} \right) \left( \frac{R}{V} \right)^{(\gamma+1)/2} \left( \frac{T_{t_0}}{p_{t_0}^{\gamma-1/\gamma}} \right)^{-(\gamma/2)} \tau \right]^{-[2/(\gamma-1)]} \quad (\text{F-20})$$

$$m = \left[ \left( \frac{R T_{t_0}}{V p_{t_0}} \right)^{(\gamma-1)/2} - C_1 \left( \frac{\gamma-1}{2} \right) \left( \frac{R}{V} \right)^{(\gamma+1)/2} \left( \frac{T_{t_0}}{p_{t_0}^{\gamma-1/\gamma}} \right)^{\gamma/2} \tau \right]^{-[2/(\gamma-1)]} \quad (\text{F-21})$$

$$p_t = \left( \frac{R T_{t_0}}{V p_{t_0}} \right)^\gamma m^\gamma \quad (\text{F-22})$$

Therefore, after combining terms

$$p_t = p_{t_0} \left[ 1 + \left( \frac{\gamma-1}{2} \right) \left( \frac{2}{\gamma+1} \right)^{(\gamma+1)/2(\gamma-1)} (\gamma R T_{t_0})^{1/2} \frac{A_g}{V} \tau \right]^{-[2\gamma/(\gamma-1)]} \quad (\text{F-23})$$

Since  $p' = 0$ , the thrust is

$$F = p_{t_0} \left[ \frac{1}{2} (1 + \cos \alpha) \gamma \left( \frac{2}{\gamma+1} \right)^{(\gamma+1)/2(\gamma-1)} \left( 1 + \frac{\gamma-1}{2} M_e^2 \right)^{-1/2} M_e A_g + \left( 1 + \frac{\gamma-1}{2} M_e^2 \right)^{-[\gamma/(\gamma-1)]} A_e \right] \\ \left[ 1 + \left( \frac{\gamma-1}{2} \right) \left( \frac{2}{\gamma+1} \right)^{(\gamma+1)/2(\gamma-1)} (\gamma R T_{t_0})^{1/2} \left( \frac{A_g}{V} \right) \tau \right]^{-[2\gamma/(\gamma-1)]} \quad (\text{F-24})$$

## APPENDIX G

## Derivation of Force vs Distance Relation for an Adiabatic Pneumatic Ejection System

The ideal gas laws are used to derive the force-distance relation for a pneumatic separation system. The existence of a regulator that either stays open or stays closed after the regulation pressure has been reached is considered.

## A. Symbols

A	area of piston face
b (subscript)	gas bottle
$c_p$	specific heat at constant pressure
$c_v$	specific heat at constant volume
E	internal energy
j	displacement of piston from closed position
$j$ (subscript)	as a function of $j$
$j_{eqp}$	The $j$ at which $p_b = p_p$ , and the regulator ceases to work
$N_i$	force due to the $i^{th}$ pneumatic piston
p	pressure
$p$ (subscript)	piston chamber
R	universal gas constant
T	absolute temperature
$V_b$	volume of gas bottle, including all lines upstream of the face of the closed piston
W	work
$\gamma$	ratio of specific heats, $c_p/c_v$
$\rho$	density
0	initial condition
'(prime)	equivalent initial conditions for regulatorless motion when $j \geq j_{eqp}$

As may be seen from Figs. G-1 and G-2, the force on the piston is

$$N_i = p_{pi} A_i \quad (G-1)$$

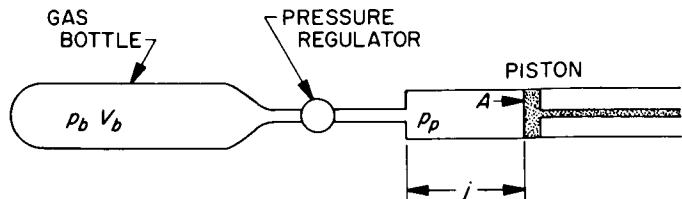

Fig. G-1. Pneumatic separation device with pressure regulator

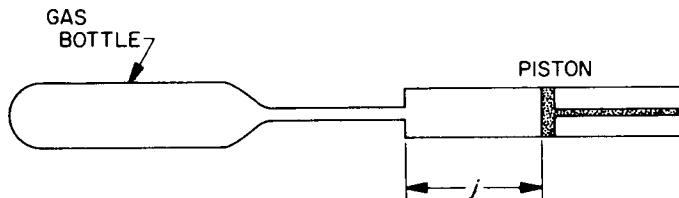

Fig. G-2. Pneumatic separation device without pressure regulator

The two cases to be considered are: (1) with a pressure regulator in the circuit, and (2) without a pressure regulator in the circuit. With a regulator, Eq. (G-2) is valid until  $p_b = p_p$ ; without a regulator, Eq. (G-3) is valid.

$$p_p = \text{constant} \quad (G-2)$$

$$p_p = p_b = p \quad (G-3)$$

## B. With Pressure Regulator

Using the law of conservation of energy on the gas contained within the system

$$E_0 = \rho_{b0} V_b c_v T_{b0} \quad (G-4)$$

$$E_j = \rho_b V_b c_v T_b + \rho_p c_v T_p A j \quad (G-5)$$

$$W_j = p_p A j \quad (G-6)$$

Assuming adiabatic conditions

$$E_0 = E_j + W_j \quad (G-7)$$

$$\rho_{b0} V_b c_v T_{b0} = \rho_b V_b c_v T_b + \rho_p c_v T_p A j + p_p A j \quad (G-8)$$

Assuming that the working fluid is a perfect gas, Eqs. (G-9), (G-10), and (G-11) are valid. Equations (G-9)

through (G-11) will then yield Eq. (G-12) which, in turn, can be reduced to Eq. (G-13).

$$p = \rho RT \quad (G-9)$$

$$R = c_p - c_v \quad (G-10)$$

$$\frac{c_v}{R} = \frac{c_v}{c_p - c_v} = \frac{1}{\frac{c_p}{c_v} - 1} = \frac{1}{\gamma - 1} \quad (G-11)$$

$$\frac{c_v}{R} V_b p_{b0} = \frac{c_v}{R} V_b p_b + \frac{c_v}{R} p_p A j + p_p A j \quad (G-12)$$

$$V_b p_{b0} = V_b p_b + \gamma p_p A j \quad (G-13)$$

Therefore

$$p_b = p_{b0} - \gamma p_b \frac{A j}{V_b} \quad (G-14)$$

The force,  $N$ , is  $p_p A$  as long as  $p_b \geq p_p$ , when  $p_b = p_p$ , which occurs at

$$j = j_{eqp} = \frac{V_b}{\gamma A} \left( \frac{p_{b0}}{p_p} - 1 \right) \quad (G-15)$$

then this is no longer true.

When  $j > j_{eqp}$ , the system acts as if there were no regulator. The new initial conditions are

$$j' = j - j_{eqp} \quad (G-16)$$

$$p'_{b0} = p_p \quad (G-17)$$

and, if the pressure regulator stays closed

$$V'_b = A j_{eqp} \quad (G-18)$$

If the regulator stays open

$$V'_b = V_b + A j_{eqp} \quad (G-19)$$

### C. Without Pressure Regulator

Using the law of conservation of energy gives

$$E_0 = \rho_0 V_b c_v T_0 \quad (G-20)$$

$$E_j = \rho c_v T (V_b + A j) \quad (G-21)$$

$$W_j = \int_0^j p A d j \quad (G-22)$$

Assuming adiabatic conditions

$$E_0 = E_j + W_j \quad (G-23)$$

$$\rho_0 V_b c_v T_0 = \rho c_v T (V_b + A j) + \int_0^j p A d j \quad (G-24)$$

Assuming a perfect gas

$$\frac{c_v}{R} V_b p_{b0} = \frac{c_v}{R} (V_b + A j) p + \int_0^j p A d j \quad (G-25)$$

$$p_{b0} = \left( 1 + \frac{A j}{V_b} \right) p + (\gamma - 1) \frac{A}{V_b} \int_0^j p d j \quad (G-26)$$

Taking the derivative of Eq. (G-27) with respect to  $j$  results in

$$0 = \left( 1 + \frac{A j}{V_b} \right) \frac{dp}{d j} + \frac{A}{V_b} p + (\gamma - 1) \frac{A}{V_b} p \quad (G-27)$$

which reduces to

$$\frac{V_b}{\gamma A} \frac{dp}{p} = - \frac{d j}{1 + \frac{A}{V_b} j} \quad (G-28)$$

Integrating Eq. (G-28) gives

$$p = C \left( 1 + \frac{A j}{V_b} \right)^{-\gamma} \quad (G-29)$$

$C$  is determined by setting  $p = p_{b0}$  when  $j = 0$ .

$$p_{b0} = C, \text{ so} \quad (G-30)$$

$$p = p_{b0} \left( 1 + \frac{A j}{V_b} \right)^{-\gamma} \quad (G-31)$$

## APPENDIX H

### Derivation of Spring Efficiency Factor Relation

Experience has shown that separation velocities calculated by equating initial spring potential energy to eventual body kinetic energy do not agree with experimental results. Typical differences are large enough to warrant inclusion of this effect in the analysis.

#### A. Symbols

$d_0$	initial spring compression distance = $S_0/k$
$d_f$	final spring compression distance = $S_f/k$
$k$	true spring rate
$k'$	artificial spring rate that gives correct velocity
$S_0$	initial spring force
$S_f$	final spring force
$S'_0$	modified initial spring force
$S'_f$	modified final spring force
$v_a$	actual separation velocity
$v_p$	separation velocity predicted using $k$
$\eta$	spring efficiency factor

#### B. Definition and Determination of $\eta$

Experimental determination of  $\eta$  does not lend itself to calculation of a different value for each spring; therefore, one value of  $\eta$  is used for all the springs.  $\eta$  is defined as

$$\eta = \frac{\text{actual separation velocity of bodies}}{\text{velocity predicted assuming perfectly efficient springs}} \quad (\text{H-1})$$

In the analysis,  $\eta$  is included by calculating an artificial spring rate that yields the correct separation velocity.

It is assumed that the actual separation velocity is determined from a test in which all angular rates are zero (i.e., only rectilinear motion is involved), so that the separation process can be modeled as a simple 2-deg of freedom system. Since only relative motions between the two bodies need be considered, this 2-deg of freedom

system degenerates to a 1-deg of freedom spring-mass system with effective mass  $m$  and composite spring constant  $k$ .

In the determination of  $k'$ , it will be required that the initial spring compression distance,  $d_0$ , and the final spring compression distance,  $d_f$ , be preserved, rather than the initial and final forces.

#### C. Effect of $\eta$ on Spring Rate

The differential equation representing the 1-deg of freedom model is

$$m\ddot{x} = k(d_0 - x) \quad (\text{H-2})$$

where

$$x = \begin{aligned} &(\text{separation distance between CM's}) \\ &- (\text{initial separation distance}) \end{aligned}$$

The initial values are

$$x(0) = \dot{x}(0) = 0$$

The solution to Eq. (H-2) is

$$\left. \begin{aligned} x(t) &= d_0 \left[ 1 - \cos \left( \frac{k}{m}^{\frac{1}{2}} t \right) \right], \\ \dot{x}(t) &= d_0 \left( \frac{k}{m} \right)^{\frac{1}{2}} \sin \left( \frac{k}{m}^{\frac{1}{2}} t \right) \end{aligned} \right\} \quad 0 \leq x \leq (d_i - d_f) \quad (\text{H-3})$$

Let  $t_f$  be the time of complete separation ( $x = d_0 - d_f$ ) for the perfectly efficient spring case, and let  $t'_f$  be the corresponding value for the actual case. Then, from Eqs. (H-1) and (H-3)

$$\eta = \frac{v_a}{v_p} = \left( \frac{k'}{k} \right)^{\frac{1}{2}} \frac{\sin \left( \frac{k'}{m}^{\frac{1}{2}} t'_f \right)}{\sin \left( \frac{k}{m}^{\frac{1}{2}} t_f \right)} \quad (\text{H-4})$$

Now when  $x = d_0 - d_f$ , from Eq. (H-3)

$$d_0 - d_f = d_0 \left[ 1 - \cos \left( \frac{k}{m} \right)^{1/2} t_f \right]$$

and

$$d_0 - d_f = d_0 \left[ 1 - \cos \left( \frac{k'}{m} \right)^{1/2} t'_f \right]$$

Thus

$$\cos \left( \frac{k}{m} \right)^{1/2} t_f = \cos \left( \frac{k'}{m} \right)^{1/2} t'_f$$

which implies that

$$\sin \left( \frac{k}{m} \right)^{1/2} t_f = \pm \sin \left( \frac{k'}{m} \right)^{1/2} t'_f \quad (\text{H-5})$$

since

$$v_a > 0 \quad \text{and} \quad v_p > 0$$

$$\sin \left( \frac{k}{m} \right)^{1/2} t_f = + \sin \left( \frac{k'}{m} \right)^{1/2} t'_f \quad (\text{H-6})$$

and Eq. (H-4) becomes

$$\eta = \left( \frac{k'}{k} \right)^{1/2}$$

Then

$$k' = \eta^2 k \quad (\text{H-7})$$

To preserve  $d_0$  and  $d_f$  with this new spring constant, new values of  $S_0$  and  $S_f$  must be used. These values are

$$S'_0 = \eta^2 S_0 \quad S'_f = \eta^2 S_f \quad (\text{H-8})$$

## APPENDIX I

### Calculation of Kinetic Energy, $\partial T / \partial q_k$ , and $d/dt (\partial T / \partial \dot{q}_k)$ as Functions of the Generalized Coordinates

The quantities  $T$ ,  $\partial T / \partial q_k$ , and  $d/dt (\partial T / \partial \dot{q}_k)$  are required as explicit functions of the generalized coordinates in the equations of motion.

#### A. Symbols

$I$  inertia matrix

$I$  components of the inertia matrix

$\dot{I}$  derivative of inertia matrix [ $\dot{I}_{jk} = \sum_i (\dot{I}_{jk})_i$ ]

$\dot{m}$   $\sum_i \dot{m}_i$

$T$  kinetic energy of the system

$v$  velocity vector of CM,  $\begin{bmatrix} \dot{x} \\ \dot{y} \\ \dot{z} \end{bmatrix}$ , in inertial coordinates

$\omega$  angular velocity about body-fixed axes,  $\begin{bmatrix} \omega_x' \\ \omega_y' \\ \omega_z' \end{bmatrix}$

#### B. Calculation of $T(q_1, \dots, q_{12})$

$$2T = m_I v_I^T v_I + m_{II} v_{II}^T v_{II} + \omega_I^T I_I \omega_I + \omega_{II}^T I_{II} \omega_{II} \quad (\text{I-1})$$

Using the results of Appendix D

$$\omega = \begin{bmatrix} \dot{\phi}(s\theta s\psi) + \dot{\theta}(c\psi) \\ \dot{\phi}(s\theta c\psi) - \dot{\theta}(s\psi) \\ \dot{\phi}(c\theta) + \dot{\psi} \end{bmatrix}$$

Thus we have

$$T(q_1, \dots, q_{12}) \quad (\text{I-2})$$

### C. Calculation of $\partial T / \partial q_s$

Clearly

$$\frac{\partial T}{\partial q_s} = 0 \quad \text{for } q_s = x_I, x_{II}, y_I, y_{II}, z_I, z_{II}, \phi_I, \phi_{II} \quad (\text{I-3})$$

The derivatives with respect to the other coordinates are

$$\frac{\partial T}{\partial q_s} = \omega_I^T \mathbf{I}_I \frac{\partial \omega_I}{\partial q_s} + \omega_{II}^T \mathbf{I}_{II} \frac{\partial \omega_{II}}{\partial q_s} \quad (\text{I-4})$$

where use has been made of the fact that the inertia matrixes are symmetric. Since the first term of Eq. (I-4) is only a function of  $\theta_I$  and  $\psi_I$ , and the second term is only a function of  $\theta_{II}$  and  $\psi_{II}$

$$\frac{\partial T}{\partial \theta} = \omega^T \mathbf{I} \frac{\partial \omega}{\partial \theta}, \frac{\partial T}{\partial \psi} = \omega^T \mathbf{I} \frac{\partial \omega}{\partial \psi} \quad (\text{I-5})$$

where

$$\frac{\partial \omega}{\partial \theta} = \begin{bmatrix} \dot{\phi}(c\theta s\psi) \\ \dot{\phi}(c\theta c\psi) \\ -\dot{\phi}(s\theta) \end{bmatrix} \quad (\text{I-6})$$

$$\frac{\partial \omega}{\partial \psi} = \begin{bmatrix} \dot{\phi}(s\theta c\psi) + \dot{\theta}(s\psi) \\ -\dot{\phi}(s\theta s\psi) - \dot{\theta}(c\psi) \\ 0 \end{bmatrix} \quad (\text{I-7})$$

The explicit forms are

$$\begin{aligned} \frac{\partial T}{\partial \theta} &= [I_{xx}(s^2 \psi) + 2I_{xy}(s\psi c\psi) + I_{yy}(c^2 \psi) - I_{zz}] \dot{\phi}^2(s\theta c\theta) \\ &\quad + (I_{xx} - I_{yy}) \dot{\theta} \dot{\phi}(c\theta s\psi c\psi) + I_{xy} \dot{\theta} \dot{\phi}(c\theta)(c^2 \psi - s^2 \psi) \\ &\quad + I_{xz} \dot{\phi}^2(s\psi)(c^2 \theta - s^2 \theta) + [I_{zz}(s\psi) + I_{yz}(c\psi)] \dot{\phi} \dot{\psi}(c\theta) \\ &\quad + [I_{yz}(s\psi) - I_{zz}(c\psi)] \dot{\theta} \dot{\phi}(s\theta) + I_{yz} \dot{\phi}^2(c\psi)(c^2 \theta - s^2 \theta) - I_{zz} \dot{\phi} \dot{\psi}(s\theta) \end{aligned} \quad (\text{I-8})$$

$$\begin{aligned} \frac{\partial T}{\partial \psi} &= (I_{xx} - I_{yy})(s\psi c\psi) [\dot{\phi}^2(s^2 \theta) - \dot{\theta}^2] + [I_{xx} - I_{yy}] \dot{\theta} \dot{\phi}(s\theta)(c^2 \psi - s^2 \psi) \\ &\quad + I_{xy} \dot{\phi}^2(s^2 \theta)(c^2 \psi - s^2 \psi) - 4I_{xy} \dot{\theta} \dot{\phi}(s\theta s\psi c\psi) \\ &\quad + [I_{zz}(c\psi) - I_{yz}(s\psi)] [\dot{\phi}(c\theta) + \dot{\psi}] \dot{\phi}(s\theta) - I_{xy} \dot{\theta}^2(c^2 \psi - s^2 \psi) \\ &\quad - \dot{\theta} [\dot{\phi}(c\theta) + \dot{\psi}] [I_{xz}(s\psi) + I_{yz}(c\psi)] \end{aligned} \quad (\text{I-9})$$

**D. Calculation of  $\partial T / \partial \dot{q}_s$** 

From Eq. (I-1) and the definition of  $\mathbf{v}$

$$\frac{\partial T}{\partial \dot{x}} = m\dot{x} \quad (I-10)$$

$$\frac{\partial T}{\partial \dot{y}} = m\dot{y} \quad (I-11)$$

$$\frac{\partial T}{\partial \dot{z}} = m\dot{z} \quad (I-12)$$

For the other coordinates

$$\frac{\partial T}{\partial \dot{q}_s} = \boldsymbol{\omega}_I^T \mathbf{I}_I \frac{\partial \boldsymbol{\omega}_I}{\partial \dot{q}_s} + \boldsymbol{\omega}_{II}^T \mathbf{I}_{II} \frac{\partial \boldsymbol{\omega}_{II}}{\partial \dot{q}_s} \quad (I-13)$$

Because of the independence of the first and second terms

$$\frac{\partial T}{\partial \theta} = \boldsymbol{\omega}^T \mathbf{I} \frac{\partial \boldsymbol{\omega}}{\partial \theta}, \quad \frac{\partial T}{\partial \phi} = \boldsymbol{\omega}^T \mathbf{I} \frac{\partial \boldsymbol{\omega}}{\partial \phi}, \quad \frac{\partial T}{\partial \psi} = \boldsymbol{\omega}^T \mathbf{I} \frac{\partial \boldsymbol{\omega}}{\partial \psi} \quad (I-14)$$

where

$$\frac{\partial \boldsymbol{\omega}}{\partial \theta} = \begin{bmatrix} (\cos \theta) & -(\sin \theta) \\ -(\sin \theta) & (\cos \theta) \\ 0 & 0 \end{bmatrix}, \quad \frac{\partial \boldsymbol{\omega}}{\partial \phi} = \begin{bmatrix} (\sin \theta \sin \psi) & (\sin \theta \cos \psi) \\ (\sin \theta \cos \psi) & (\cos \theta \cos \psi) \\ 0 & 0 \end{bmatrix}, \quad \frac{\partial \boldsymbol{\omega}}{\partial \psi} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \quad (I-15)$$

**E. Calculation of  $d/dt (\partial T / \partial \dot{q}_s)$** 

$$\frac{d}{dt} \left( \frac{\partial T}{\partial \dot{x}} \right) = m\ddot{x} \quad (I-16)$$

$$\frac{d}{dt} \left( \frac{\partial T}{\partial \dot{y}} \right) = m\ddot{y} \quad (I-17)$$

$$\frac{d}{dt} \left( \frac{\partial T}{\partial \dot{z}} \right) = m\ddot{z} \quad (I-18)$$

For the other coordinates

$$\frac{d}{dt} \left( \frac{\partial T}{\partial \dot{q}_s} \right) = \dot{\boldsymbol{\omega}}_I^T \mathbf{I}_I \frac{\partial \boldsymbol{\omega}_I}{\partial \dot{q}_s} + \boldsymbol{\omega}_I^T \mathbf{I}_I \frac{d}{dt} \left[ \frac{\partial \boldsymbol{\omega}_I}{\partial \dot{q}_s} \right] + \boldsymbol{\omega}_I^T \dot{\mathbf{I}}_I \frac{\partial \boldsymbol{\omega}_I}{\partial \dot{q}_s} + \dot{\boldsymbol{\omega}}_{II}^T \mathbf{I}_{II} \frac{\partial \boldsymbol{\omega}_{II}}{\partial \dot{q}_s} + \boldsymbol{\omega}_{II}^T \mathbf{I}_{II} \frac{d}{dt} \left[ \frac{\partial \boldsymbol{\omega}_{II}}{\partial \dot{q}_s} \right] \quad (I-19)$$

Because of the independence of the first terms in Eq. (I-19) from the last three

$$\frac{d}{dt} \left( \frac{\partial T}{\partial \dot{q}_s} \right) = \dot{\boldsymbol{\omega}}^T \mathbf{I} \frac{\partial \boldsymbol{\omega}}{\partial \dot{q}_s} + \boldsymbol{\omega}^T \mathbf{I} \frac{d}{dt} \left[ \frac{\partial \boldsymbol{\omega}}{\partial \dot{q}_s} \right] \quad (I-20)$$

Equation (I-20) applies subscripted with a I when  $q_s = \theta_I, \phi_I, \psi_I$ , and subscripted with a II when  $q_s = \theta_{II}, \phi_{II}, \psi_{II}$ .

$$\dot{\boldsymbol{\omega}}_I = \begin{bmatrix} \ddot{\phi} (\sin \theta \sin \psi) + \dot{\phi} \dot{\theta} (\cos \theta \sin \psi) + \dot{\phi} \dot{\psi} (\sin \theta \cos \psi) + \ddot{\theta} (\cos \psi) - \dot{\theta} \dot{\psi} (\sin \psi) \\ \ddot{\phi} (\sin \theta \cos \psi) + \dot{\phi} \dot{\theta} (\cos \theta \cos \psi) - \dot{\phi} \dot{\psi} (\sin \theta \sin \psi) - \ddot{\theta} (\sin \psi) - \dot{\theta} \dot{\psi} (\cos \psi) \\ \ddot{\phi} (\cos \theta) - \dot{\phi} \dot{\theta} (\sin \theta) + \ddot{\psi} \end{bmatrix}$$

$$\frac{d}{dt} \left[ \frac{\partial \boldsymbol{\omega}}{\partial \theta} \right] = \begin{bmatrix} (-\sin \psi) \dot{\psi} \\ (-\cos \psi) \dot{\psi} \\ 0 \end{bmatrix} \quad (I-21)$$

$$\frac{d}{dt} \left[ \frac{\partial \omega}{\partial \dot{\phi}} \right] = \begin{bmatrix} (c\theta s\psi) \dot{\theta} + (s\theta c\psi) \dot{\psi} \\ (c\theta c\psi) \dot{\theta} - (s\theta s\psi) \dot{\psi} \\ (-s\theta) \dot{\theta} \end{bmatrix} \quad (I-22)$$

$$\frac{d}{dt} \left[ \frac{\partial \omega}{\partial \dot{\psi}} \right] = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad (I-23)$$

Therefore, the explicit forms of  $d/dt [\partial T/\partial q_s]$  for  $q_s = \theta, \phi, \psi$  are

$$\begin{aligned} \frac{d}{dt} \left( \frac{\partial T}{\partial \theta} \right) &= \ddot{\phi} \{ (s\theta) [(I_{xx} - I_{yy}) (s\psi c\psi) + I_{xy} (c^2 \psi - s^2 \psi)] + (c\theta) [I_{xz} (c\psi) - I_{yz} (s\psi)] \} \\ &\quad + \ddot{\psi} \{ I_{xz} (c\psi) - I_{yz} (s\psi) \} + \phi \{ (c\theta) \theta [(I_{xx} - I_{yy}) (s\psi c\psi) + I_{xy} (c^2 \psi - s^2 \psi)] \\ &\quad + (s\theta) \dot{\psi} [(I_{xx} - I_{yy}) (c^2 \psi - s^2 \psi) - 4I_{xy} (s\psi c\psi)] - (s\theta) \dot{\theta} [I_{xz} (c\psi) - I_{yz} (s\psi)] \} \\ &\quad - (c\theta) \dot{\psi} [I_{xz} (s\psi) + I_{yz} (c\psi)] - 2\dot{\theta} \dot{\psi} \{ [I_{xx} - I_{yy}] (s\psi c\psi) + I_{xy} (c^2 \psi - s^2 \psi) \} \\ &\quad - \dot{\psi}^2 \{ I_{xz} (s\psi) + I_{yz} (c\psi) \} \end{aligned} \quad (I-24)$$

$$\begin{aligned} \frac{d}{dt} \left( \frac{\partial T}{\partial \phi} \right) &= \ddot{\theta} \{ (s\theta) [(I_{xx} - I_{yy}) (s\psi c\psi) + I_{xy} (c^2 \psi - s^2 \psi)] + (c\theta) [I_{xz} (c\psi) - I_{yz} (s\psi)] \} \\ &\quad + \ddot{\phi} \{ (s^2 \theta) [I_{xx} (s^2 \psi) + 2I_{xy} (s\psi c\psi) + I_{yy} (c^2 \psi)] + 2(s\theta c\theta) [I_{xz} (s\psi) + I_{yz} (c\psi)] + (c^2 \theta) I_{zz} \} \\ &\quad + \ddot{\psi} \{ (s\theta) [I_{xz} (s\psi) + I_{yz} (c\psi)] + (c\theta) I_{zz} \} + 2\dot{\phi} \{ \dot{\theta} (s\theta c\theta) [I_{xx} (s^2 \psi) + 2I_{xy} (s\psi c\psi) + I_{yy} (c^2 \psi) - I_{zz}] \\ &\quad + \dot{\psi} (s^2 \theta) [(I_{xx} - I_{yy}) (s\psi c\psi) + I_{xy} (c^2 \psi - s^2 \psi)] + \dot{\theta} (c^2 \theta - s^2 \theta) [I_{xz} (s\psi) + I_{yz} (c\psi)] \} \\ &\quad + \dot{\psi} (s\theta c\theta) [I_{xz} (c\psi) - I_{yz} (s\psi)] + \dot{\theta} \{ \dot{\theta} (c\theta) [(I_{xx} - I_{yy}) (s\psi c\psi) + I_{xy} (c^2 \psi - s^2 \psi)] \\ &\quad + \dot{\psi} (s\theta) [(I_{xx} - I_{yy}) (c^2 \psi - s^2 \psi) - 4I_{xy} (s\psi c\psi)] - \dot{\theta} (s\theta) [I_{xz} (c\psi) - I_{yz} (s\psi)] \} \\ &\quad + \dot{\psi} \{ \dot{\psi} (s\theta) [I_{xz} (s\psi) - I_{yz} (s\psi)] - \dot{\theta} (s\theta) I_{zz} \} \end{aligned} \quad (I-25)$$

$$\begin{aligned} \frac{d}{dt} \left( \frac{\partial T}{\partial \psi} \right) &= \ddot{\theta} \{ I_{xz} (c\psi) - I_{yz} (s\psi) \} + \ddot{\phi} \{ (s\theta) [I_{xz} (s\psi) + I_{yz} (c\psi)] + (c\theta) I_{zz} \} \\ &\quad + \ddot{\psi} I_{zz} + \dot{\phi} \{ \dot{\theta} (c\theta) [I_{xz} (s\psi) + I_{yz} (c\psi)] + \dot{\psi} (s\theta) [I_{xz} (c\psi) - I_{yz} (s\psi)] - \dot{\theta} (s\theta) I_{zz} \} \\ &\quad - \dot{\theta} \dot{\psi} \{ I_{xz} (s\psi) + I_{yz} (c\psi) \} \end{aligned} \quad (I-26)$$

## APPENDIX J

### Constraints

As discussed in Section VII, the constraint conditions are incorporated by means of the Lagrange multiplier technique. It is assumed that the spring constraint and the pin-puller constraint do not act simultaneously.

The equations of motion for the constrained case are

$$\frac{d}{dt} \frac{\partial T}{\partial \dot{q}_s} - \frac{\partial T}{\partial q_s} = \mathcal{Q}'_s + \sum_l \lambda_l e_{ls} \quad s = x_1, y_1, \dots, \phi_{II}, \psi_{II} \quad (J-1)$$

$$\sum_s e_{ls} \ddot{q}_s = r_l \quad l = 1, 2, \dots, l_m \quad (\text{J-2})$$

where the constraint equations are

$$\begin{aligned} f_1 &= 0 \\ f_2 &= 0 \\ \dots \dots \\ f_{l_m} &= 0 \end{aligned} \quad (\text{J-3})$$

and where

$$e_{ls} = \frac{\partial f_l}{\partial q_s} \quad (\text{J-4})$$

$$e_{lt} = \frac{\partial f_l}{\partial t} = 0 \quad (\text{J-5})$$

$$r_l = -\sum_s \dot{e}_{ls} \dot{q}_s \quad (\text{J-6})$$

The pin-puller delay constraint is the condition that, until  $t = t_i$ , a point  $i$  on body I remains coincident with a point on body II. Then

$$d_i = 0 \Rightarrow d_i = 0 \Rightarrow d_{ix} = 0, \quad d_{iy} = 0, \quad d_{iz} = 0$$

Let

$$f_1 = d_{ix}, \quad f_2 = d_{iy}, \quad f_3 = d_{iz}$$

and let

$$\mathbf{f} = \begin{bmatrix} f_1 \\ f_2 \\ f_3 \end{bmatrix} \quad \mathbf{r} = \begin{bmatrix} x_I - x_{II} \\ y_I - y_{II} \\ z_I - z_{II} \end{bmatrix} \quad \mathbf{r}'_{Ii} = \begin{bmatrix} x'_{Ii} \\ y'_{Ii} \\ z'_{Ii} \end{bmatrix} \quad \mathbf{r}'_{IIi} = \begin{bmatrix} x'_{IIi} \\ y'_{IIi} \\ z'_{IIi} \end{bmatrix} \quad \mathbf{e}_s = \begin{bmatrix} e_{1s} \\ e_{2s} \\ e_{3s} \end{bmatrix} \quad (\text{J-7})$$

Then

$$\mathbf{f} = \mathbf{A}_{II}^T \mathbf{r}'_{IIi} - \mathbf{A}_I^T \mathbf{r}'_{Ii} - \mathbf{r} \quad (\text{J-8})$$

and

$$\mathbf{e}_s = \frac{\partial \mathbf{f}}{\partial q_s} = \frac{\partial \mathbf{A}_{II}^T}{\partial q_s} \mathbf{r}'_{IIi} = \frac{\partial \mathbf{A}_I^T}{\partial q_s} \mathbf{r}'_{Ii} - \frac{\partial \mathbf{r}}{\partial q_s} \quad (\text{J-9})$$

where

$$\frac{\partial a_{ij}}{\partial \theta_{II}} = \frac{\partial a_{ij}}{\partial \phi_{II}} = \frac{\partial a_{ij}}{\partial \psi_{II}} = \frac{\partial b_{ij}}{\partial \theta_I} = \frac{\partial b_{ij}}{\partial \phi_I} = \frac{\partial b_{ij}}{\partial \psi_I} = \frac{\partial c_{ij}}{\partial x_I} = \frac{\partial c_{ij}}{\partial y_I} = \frac{\partial c_{ij}}{\partial z_I} = \frac{\partial c_{ij}}{\partial x_{II}} = \frac{\partial c_{ij}}{\partial y_{II}} = \frac{\partial c_{ij}}{\partial z_{II}} = 0 \quad (\text{J-10})$$

for  $i, j = 1, 2, 3$ .

$$\frac{\partial \mathbf{A}}{\partial \theta} = \begin{bmatrix} (s\theta s\phi s\psi) & (-s\theta c\phi s\psi) & (c\theta s\psi) \\ (s\theta s\phi c\psi) & (-s\theta c\phi c\psi) & (c\theta c\psi) \\ (c\theta s\phi) & (-c\theta c\phi) & (-s\theta) \end{bmatrix} \quad (\text{J-11})$$

$$\frac{\partial \mathbf{A}}{\partial \phi} = \begin{bmatrix} -c_{12} & c_{11} & 0 \\ -c_{22} & c_{21} & 0 \\ -c_{32} & c_{31} & 0 \end{bmatrix}$$

$$\frac{\partial \mathbf{A}}{\partial \psi} = \begin{bmatrix} c_{21} & c_{22} & c_{23} \\ -c_{11} & -c_{12} & -c_{13} \\ 0 & 0 & 0 \end{bmatrix} \quad (J-12)$$

and

$$\frac{\partial \mathbf{r}}{\partial \theta_I} = \frac{\partial \mathbf{r}}{\partial \theta_{II}} = \frac{\partial \mathbf{r}}{\partial \phi_I} = \frac{\partial \mathbf{r}}{\partial \phi_{II}} = \frac{\partial \mathbf{r}}{\partial \psi_I} = \frac{\partial \mathbf{r}}{\partial \psi_{II}} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad (J-13)$$

$$\frac{\partial \mathbf{r}}{\partial x_I} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \quad \frac{\partial \mathbf{r}}{\partial y_I} = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}, \quad \frac{\partial \mathbf{r}}{\partial z_I} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}, \quad \frac{\partial \mathbf{r}}{\partial x_{II}} = \begin{bmatrix} -1 \\ 0 \\ 0 \end{bmatrix}, \quad \frac{\partial \mathbf{r}}{\partial y_{II}} = \begin{bmatrix} 0 \\ -1 \\ 0 \end{bmatrix}, \quad \frac{\partial \mathbf{r}}{\partial z_{II}} = \begin{bmatrix} 0 \\ 0 \\ -1 \end{bmatrix} \quad (J-14)$$

Now

$$\dot{\mathbf{e}}_s = \frac{d}{dt} \left[ \frac{\partial \mathbf{A}_{II}^T}{\partial q_s} \right] \mathbf{r}'_{IIi} - \frac{d}{dt} \left[ \frac{\partial \mathbf{A}_I^T}{\partial q_s} \right] \mathbf{r}'_{Ii} - \frac{d}{dt} \left[ \frac{\partial \mathbf{r}}{\partial q_s} \right] \quad (J-15)$$

where

$$\frac{d}{dt} \left[ \frac{\partial \mathbf{A}}{\partial \theta} \right] = \begin{bmatrix} (c\theta s\phi s\psi) \dot{\theta} + (s\theta c\phi s\psi) \dot{\phi} + (s\theta s\phi c\psi) \dot{\psi}, & (-c\theta c\phi s\psi) \dot{\theta} + (s\theta s\phi s\psi) \dot{\phi} - (s\theta c\phi c\psi) \dot{\psi}, & -(s\theta s\psi) \dot{\theta} + (c\theta c\psi) \dot{\psi} \\ (c\theta s\phi c\psi) \dot{\theta} + (s\theta c\phi c\psi) \dot{\psi} - (s\theta s\phi s\psi) \dot{\psi}, & -(c\theta c\phi c\psi) \dot{\theta} + (s\theta s\phi c\psi) \dot{\phi} + (s\theta c\phi s\psi) \dot{\phi}, & -(s\theta c\psi) \dot{\theta} - (c\theta s\psi) \dot{\psi} \\ -(s\theta s\phi) \dot{\theta} + (c\theta c\phi) \dot{\phi}, & (s\theta c\phi) \dot{\theta} + (c\theta s\phi) \dot{\phi}, & -(c\theta) \dot{\theta} \end{bmatrix} \quad (J-16)$$

$$\frac{d}{dt} \left[ \frac{\partial \mathbf{A}}{\partial \phi} \right] = \begin{bmatrix} -\dot{c}_{12} & \dot{c}_{11} & 0 \\ -\dot{c}_{22} & \dot{c}_{21} & 0 \\ -\dot{c}_{32} & \dot{c}_{31} & 0 \end{bmatrix} \quad (J-17)$$

$$\frac{d}{dt} \left[ \frac{\partial \mathbf{A}}{\partial \psi} \right] = \begin{bmatrix} \dot{c}_{21} & \dot{c}_{22} & \dot{c}_{23} \\ -\dot{c}_{11} & -\dot{c}_{12} & -\dot{c}_{13} \\ 0 & 0 & 0 \end{bmatrix} \quad (J-18)$$

and the last term of Eq. (J-15) vanishes.

Then, with  $r_1, r_2, r_3$  given by Eq. (J-6), the constrained equation of motion is

$$[\mathbf{F}] \begin{bmatrix} \ddot{q} \\ \lambda \end{bmatrix} = \begin{bmatrix} \mathcal{Q}' \\ r \end{bmatrix} \quad (J-19)$$

$$\begin{bmatrix} \ddot{\mathbf{q}} \\ \lambda \end{bmatrix} = \begin{bmatrix} \ddot{x}_I \\ \ddot{y}_I \\ \ddot{z}_I \\ \ddot{\theta}_I \\ \ddot{\phi}_I \\ \ddot{\psi}_I \\ \ddot{x}_{II} \\ \ddot{y}_{II} \\ \ddot{z}_{II} \\ \ddot{\theta}_{II} \\ \ddot{\phi}_{II} \\ \ddot{\psi}_{II} \\ \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix} \quad \begin{bmatrix} \mathcal{Q}' \\ r \end{bmatrix} = \begin{bmatrix} \mathcal{Q}'_{xI} \\ \mathcal{Q}'_{yI} \\ \mathcal{Q}'_{zI} \\ p'_{1I} \\ p'_{2I} \\ p'_{3I} \\ \mathcal{Q}'_{xII} \\ \mathcal{Q}'_{yII} \\ \mathcal{Q}'_{zII} \\ p'_{1II} \\ p'_{2II} \\ p'_{3II} \\ r_1 \\ r_2 \\ r_3 \end{bmatrix} \quad (J-20)$$

(J-21)

$$[\mathbf{F}] = \begin{bmatrix} m_I & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -1 & 0 & 0 \\ 0 & m_I & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -1 & 0 \\ 0 & 0 & m_I & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -1 \\ 0 & 0 & 0 & m_{11I} & m_{12I} & m_{13I} & 0 & 0 & 0 & 0 & 0 & e_{1\theta I} & e_{2\theta I} & e_{3\theta I} \\ 0 & 0 & 0 & m_{21I} & m_{22I} & m_{23I} & 0 & 0 & 0 & 0 & 0 & e_{1\phi I} & e_{2\phi I} & 0 \\ 0 & 0 & 0 & m_{31I} & m_{32I} & m_{33I} & 0 & 0 & 0 & 0 & 0 & e_{1\psi I} & e_{2\psi I} & e_{3\psi I} \\ 0 & 0 & 0 & 0 & 0 & 0 & m_{II} & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{II} & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{11II} & m_{12II} & m_{13II} & e_{1\theta II} & e_{2\theta II} & e_{3\theta II} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{21II} & m_{22II} & m_{23II} & e_{1\phi II} & e_{2\phi II} & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{31II} & m_{32II} & m_{33II} & e_{1\psi II} & e_{2\psi II} & e_{3\psi II} \\ -1 & 0 & 0 & e_{1\theta I} & e_{1\phi I} & e_{1\psi I} & 1 & 0 & 0 & e_{1\theta II} & e_{1\phi II} & e_{1\psi II} & 0 & 0 & 0 \\ 0 & -1 & 0 & e_{2\theta I} & e_{2\phi I} & e_{2\psi I} & 0 & 1 & 0 & e_{2\theta II} & e_{2\phi II} & e_{2\psi II} & 0 & 0 & 0 \\ 0 & 0 & -1 & e_{3\theta I} & 0 & e_{3\psi I} & 0 & 0 & 1 & e_{3\theta II} & 0 & e_{3\psi II} & 0 & 0 & 0 \end{bmatrix} \quad (J-22)$$

At each step of the integration during which the constraint is acting, Eq. (J-19) is solved for the accelerations  $\ddot{q}_s$ , which are then integrated.

The hard-mounted spring constraint is the condition that, at the tips of the hard-mounted springs, neither translation nor rotation in a plane perpendicular to the springs is permitted. Thus,  $g_x = g_z = 0$  (see Appendix K) and  $h = 0$  (see Appendix L).

Let

$$\begin{aligned} \mathbf{r} &= \begin{bmatrix} x_I - x_{II} \\ y_I - y_{II} \\ z_I - z_{II} \end{bmatrix}, & \mathbf{r}_{Il} &= \begin{bmatrix} x'_{Il} \\ y'_{Il} \\ z'_{Il} \end{bmatrix}, & \mathbf{r}_{Im} &= \begin{bmatrix} x'_{Im} \\ y'_{Im} \\ z'_{Im} \end{bmatrix} \\ \mathbf{v}_k &= \begin{bmatrix} v_{kx} \\ v_{ky} \\ v_{kz} \end{bmatrix}, & \mathbf{d}_k &= \begin{bmatrix} d_{kx} \\ d_{ky} \\ d_{kz} \end{bmatrix}, & \mathbf{p}_k &= \begin{bmatrix} \rho_{kx} \\ \rho_{ky} \\ \rho_{kz} \end{bmatrix} \end{aligned} \quad (J-23)$$

The symbols  $l, m$  refer to the first and second springs in the input, and  $k$  refers to either.

The constraint equations are then

$$f_1 = g_x = \mathbf{b}_{(1)}^T \mathbf{r} + \mathbf{t}_{(1)}^T \mathbf{r}'_{II} - x'_{IIl} - j_l \rho_{lx} = 0 \quad (J-24)$$

$$f_2 = g_z = \mathbf{b}_{(3)}^T \mathbf{r} + \mathbf{t}_{(3)}^T \mathbf{r}'_{II} - z'_{IIl} - j_l \rho_{lz} = 0 \quad (J-25)$$

Since  $h = 0$  only when the numerator (Eq. L-13, Appendix L) vanishes

$$f_3 = \mathbf{t}_{(3)}^T \mathbf{r} (x'_{IIl} - j_l \rho_{lx} - x'_{IIm} - j_m \rho_{mx}) - \mathbf{t}_{(1)}^T \mathbf{r} (z'_{IIl} + j_l \rho_{lz} - z'_{IIm} - j_m \rho_{mz}) = 0 \quad (J-26)$$

We will have need for

$$\frac{d}{dt} \left[ \frac{\partial \mathbf{A}_{II}}{\partial q_s} \right]$$

and

$$\frac{d}{dt} \left[ \frac{\partial \mathbf{A}_I}{\partial q_s} \right], \quad s = 1, \dots, 12$$

For convenience, only

$$\frac{d}{dt} \left[ \frac{\partial \mathbf{A}_{II}}{\partial q_s} \right]$$

is computed; the rest are found by replacing II by I, and  $b$  by  $a$ .

$$\frac{d}{dt} \left( \frac{\partial b_{11}}{\partial \theta_{II}} \right) = (c\theta_{II} s\phi_{II} s\psi_{II}) \dot{\theta}_{II} + (s\theta_{II} c\phi_{II} s\psi_{II}) \dot{\phi}_{II} + (s\theta_{II} s\phi_{II} c\psi_{II}) \dot{\psi}_{II} \quad (J-27)$$

$$\frac{d}{dt} \left( \frac{\partial b_{12}}{\partial \theta_{II}} \right) = -(c\theta_{II} c\phi_{II} s\phi_{II}) \dot{\theta}_{II} + (s\theta_{II} s\phi_{II} s\psi_{II}) \dot{\phi}_{II} - (s\theta_{II} c\phi_{II} c\psi_{II}) \dot{\psi}_{II} \quad (J-28)$$

$$\frac{d}{dt} \left( \frac{\partial b_{13}}{\partial \theta_{II}} \right) = -(s\theta_{II} s\psi_{II}) \dot{\theta}_{II} + (c\theta_{II} c\psi_{II}) \dot{\psi}_{II} \quad (J-29)$$

$$\frac{d}{dt} \left( \frac{\partial b_{21}}{\partial \theta_{II}} \right) = (c\theta_{II} s\phi_{II} c\psi_{II}) \dot{\theta}_{II} + (s\theta_{II} c\phi_{II} c\psi_{II}) \dot{\phi}_{II} - (s\theta_{II} s\phi_{II} s\psi_{II}) \dot{\psi}_{II} \quad (J-30)$$

$$\frac{d}{dt} \left( \frac{\partial b_{22}}{\partial \theta_{II}} \right) = -(c\theta_{II} c\phi_{II} c\psi_{II}) \dot{\theta}_{II} + (s\theta_{II} s\phi_{II} c\psi_{II}) \dot{\phi}_{II} + (s\theta_{II} c\phi_{II} s\psi_{II}) \dot{\psi}_{II} \quad (J-31)$$

$$\frac{d}{dt} \left( \frac{\partial b_{23}}{\partial \theta_{II}} \right) = -(s\theta_{II} c\psi_{II}) \dot{\theta}_{II} - (c\theta_{II} s\psi_{II}) \dot{\psi}_{II} \quad (J-32)$$

$$\frac{d}{dt} \left( \frac{\partial b_{31}}{\partial \theta_{II}} \right) = -(s\theta_{II} s\phi_{II}) \dot{\theta}_{II} + (c\theta_{II} c\phi_{II}) \dot{\phi}_{II} \quad (J-33)$$

$$\frac{d}{dt} \left( \frac{\partial b_{32}}{\partial \theta_{II}} \right) = (s\theta_{II} c\phi_{II}) \dot{\theta}_{II} + (c\theta_{II} s\phi_{II}) \dot{\phi}_{II} \quad (J-34)$$

$$\frac{d}{dt} \left( \frac{\partial b_{33}}{\partial \theta_{II}} \right) = -(c\theta_{II}) \dot{\theta}_{II} \quad (J-35)$$

$$\frac{d}{dt} \left[ \frac{\partial \mathbf{A}_{II}}{\partial \phi_{II}} \right] = \begin{bmatrix} -\dot{b}_{12} & \dot{b}_{11} & 0 \\ -\dot{b}_{22} & \dot{b}_{21} & 0 \\ -\dot{b}_{32} & \dot{b}_{31} & 0 \end{bmatrix} \quad (J-36)$$

$$\frac{d}{dt} \left[ \frac{\partial \mathbf{A}_{II}}{\partial \psi_{II}} \right] = \begin{bmatrix} \dot{b}_{21} & \dot{b}_{22} & \dot{b}_{23} \\ -\dot{b}_{11} & -\dot{b}_{12} & -\dot{b}_{13} \\ 0 & 0 & 0 \end{bmatrix} \quad (J-37)$$

Clearly

$$\frac{d}{dt} \left[ \frac{\partial \mathbf{A}_{II}}{\partial q_s} \right] = 0 \quad \text{for } s = I_x, \dots, II_z \quad (J-38)$$

Now

$$\frac{\partial \mathbf{r}}{\partial x_I} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \quad (J-39)$$

$$\frac{\partial \mathbf{r}}{\partial y_I} = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} \quad (J-40)$$

$$\frac{\partial \mathbf{r}}{\partial z_I} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \quad (J-41)$$

$$\frac{\partial \mathbf{r}}{\partial x_{II}} = \begin{bmatrix} -1 \\ 0 \\ 0 \end{bmatrix} \quad (J-42)$$

$$\frac{\partial \mathbf{r}}{\partial y_{II}} = \begin{bmatrix} 0 \\ -1 \\ 0 \end{bmatrix} \quad (J-43)$$

$$\frac{\partial \mathbf{r}}{\partial z_{II}} = \begin{bmatrix} 0 \\ 0 \\ -1 \end{bmatrix} \quad (J-44)$$

$$\frac{\partial \mathbf{r}}{\partial q_s} = 0 \quad \text{for all other } q_s \quad (J-45)$$

The following expressions also will be needed

$$\dot{\mathbf{T}} = \dot{\mathbf{A}}_{II} \mathbf{A}_I^T + \mathbf{A}_{II} \dot{\mathbf{A}}_I^T \quad (J-46)$$

$$\frac{\partial T}{\partial q_s} = \frac{\partial \mathbf{A}_{II}}{\partial q_s} \mathbf{A}_I^T + \mathbf{A}_{II} \frac{\partial \mathbf{A}_I^T}{\partial q_s} \quad (J-47)$$

$$\frac{d}{dt} \left[ \frac{\partial T}{\partial q_s} \right] = \frac{d}{dt} \left[ \frac{\partial \mathbf{A}_{II}}{\partial q_s} \right] \mathbf{A}_I^T + \frac{\partial \mathbf{A}_{II}}{\partial q_s} \dot{\mathbf{A}}_I^T + \dot{\mathbf{A}}_{II} \frac{\partial \mathbf{A}_I^T}{\partial q_s} + \mathbf{A}_{II} \frac{d}{dt} \left[ \frac{\partial \mathbf{A}_I^T}{\partial q_s} \right] \quad (J-48)$$

Now let

$$f_k = \mathbf{a}^{(2)\text{T}} \mathbf{d}_k \quad (\text{J-49})$$

$$g_k = \mathbf{a}^{(2)\text{T}} \mathbf{A}_{\text{II}}^{\text{T}} \boldsymbol{\rho}_k \quad (\text{J-50})$$

Then, from Appendix B

$$j_k = \frac{f_k}{g_k} \quad (\text{J-51})$$

$$\dot{f}_k = \dot{\mathbf{a}}^{(2)\text{T}} \mathbf{d}_k + \mathbf{a}^{(2)\text{T}} \mathbf{v}_k \quad (\text{J-52})$$

$$\dot{g}_k = \dot{\mathbf{a}}^{(2)\text{T}} \mathbf{A}_{\text{II}}^{\text{T}} \boldsymbol{\rho}_k + \mathbf{a}^{(2)\text{T}} \dot{\mathbf{A}}_{\text{II}}^{\text{T}} \boldsymbol{\rho}_k \quad (\text{J-53})$$

and

$$\dot{j}_k = \frac{1}{g_k} (\dot{f}_k - j_k \dot{g}_k) \quad (\text{J-54})$$

$$\frac{\partial f_k}{\partial q_s} = \frac{\partial \mathbf{a}^{(2)\text{T}}}{\partial q_s} \mathbf{d}_k + \mathbf{a}^{(2)\text{T}} \left( \frac{\partial \mathbf{r}}{\partial q_s} + \frac{\partial \mathbf{A}_{\text{I}}^{\text{T}}}{\partial q_s} \mathbf{r}'_{1k} - \frac{\partial \mathbf{A}_{\text{II}}^{\text{T}}}{\partial q_s} \mathbf{r}'_{11k} \right) \quad (\text{J-55})$$

$$\frac{\partial g_k}{\partial q_s} = \frac{\partial \mathbf{a}^{(2)\text{T}}}{\partial q_s} \mathbf{A}_{\text{II}}^{\text{T}} \boldsymbol{\rho}_k + \mathbf{a}^{(2)\text{T}} \frac{\partial \mathbf{A}_{\text{II}}^{\text{T}}}{\partial q_s} \boldsymbol{\rho}_k \quad (\text{J-56})$$

$$\frac{\partial j_k}{\partial q_s} = \frac{1}{g_k} \left[ \frac{\partial f_k}{\partial q_s} - j_k \frac{\partial g_k}{\partial q_s} \right] \quad (\text{J-57})$$

Now let

$$f'_k = \frac{\partial f_k}{\partial q_s} - j_k \frac{\partial g_k}{\partial q_s} \quad (\text{J-58})$$

Then

$$\begin{aligned} \frac{d}{dt} \left[ \frac{\partial f_k}{\partial q_s} \right] &= \frac{d}{dt} \left[ \frac{\partial \mathbf{a}^{(2)\text{T}}}{\partial q_s} \right] \mathbf{d}_k + \frac{\partial \mathbf{a}^{(2)\text{T}}}{\partial q_s} \mathbf{v}_k + \dot{\mathbf{a}}^{(2)\text{T}} \left[ \frac{\partial \mathbf{r}}{\partial q_s} + \frac{\partial \mathbf{A}_{\text{I}}^{\text{T}}}{\partial q_s} \mathbf{r}'_{1k} - \frac{\partial \mathbf{A}_{\text{II}}^{\text{T}}}{\partial q_s} \mathbf{r}'_{11k} \right] \\ &\quad + \mathbf{a}^{(2)\text{T}} \left[ \frac{d}{dt} \left( \frac{\partial \mathbf{A}_{\text{I}}^{\text{T}}}{\partial q_s} \right) \mathbf{r}'_{1k} - \frac{d}{dt} \left( \frac{\partial \mathbf{A}_{\text{II}}^{\text{T}}}{\partial q_s} \right) \mathbf{r}'_{11k} \right] \end{aligned} \quad (\text{J-59})$$

$$\begin{aligned} \frac{d}{dt} \left[ \frac{\partial g_k}{\partial q_s} \right] &= \frac{d}{dt} \left[ \frac{\partial \mathbf{a}^{(2)\text{T}}}{\partial q_s} \right] \mathbf{A}_{\text{II}}^{\text{T}} \boldsymbol{\rho}_k + \frac{\partial \mathbf{a}^{(2)\text{T}}}{\partial q_s} \dot{\mathbf{A}}_{\text{II}}^{\text{T}} \boldsymbol{\rho}_k \\ &\quad + \dot{\mathbf{a}}^{(2)\text{T}} \frac{\partial \mathbf{A}_{\text{II}}^{\text{T}}}{\partial q_s} \boldsymbol{\rho}_k + \mathbf{a}^{(2)\text{T}} \frac{d}{dt} \left[ \frac{\partial \mathbf{A}_{\text{II}}^{\text{T}}}{\partial q_s} \right] \boldsymbol{\rho}_k \end{aligned} \quad (\text{J-60})$$

Then

$$\dot{f}'_k = \frac{d}{dt} \left( \frac{\partial f_k}{\partial q_s} \right) - j_k \left( \frac{\partial g_k}{\partial q_s} \right) - j_k \frac{d}{dt} \left( \frac{\partial g_k}{\partial q_s} \right) \quad (\text{J-61})$$

and

$$\frac{d}{dt} \left( \frac{\partial j_k}{\partial q_s} \right) = \frac{1}{g_k} \left[ \dot{f}'_k - \left( \frac{\partial j_k}{\partial q_s} \right) \frac{d}{dt} \left( \frac{\partial g_k}{\partial q_s} \right) \right] \quad (\text{J-62})$$

Thus, for the coefficients  $e_{ls}$  we have

$$e_{15} = \frac{\partial \mathbf{b}_{(1)}^T}{\partial q_s} \mathbf{r} + \mathbf{b}_{(1)}^T \frac{\partial \mathbf{r}}{\partial q_s} + \frac{\partial \mathbf{t}_{(1)}^T}{\partial q_s} \mathbf{r}'_l - \frac{\partial j_l}{\partial q_s} \rho_{lx} \quad (\text{J-63})$$

$$e_{25} = \frac{\partial \mathbf{b}_{(3)}^T}{\partial q_s} \mathbf{r} + \mathbf{b}_{(3)}^T \frac{\partial \mathbf{r}}{\partial q_s} + \frac{\partial \mathbf{t}_{(3)}^T}{\partial q_s} \mathbf{r}'_l - \frac{\partial j_l}{\partial q_s} \rho_{lx} \quad (\text{J-64})$$

$$\begin{aligned} e_{35} = & \frac{\partial \mathbf{t}_{(3)}^T}{\partial q_s} (\mathbf{r}'_l - \mathbf{r}'_{Im}) (\mathbf{x}'_{IIl} + j_l \rho_{lx} - x'_{IIm} - j_m \rho_{mx}) + \mathbf{t}_{(3)}^T (\mathbf{r}'_l - \mathbf{r}'_{Im}) \left( \frac{\partial j_l}{\partial q_s} \rho_{lx} - \frac{\partial j_m}{\partial q_s} \rho_{mx} \right) \\ & - \frac{\partial \mathbf{t}_{(1)}^T}{\partial q_s} (\mathbf{r}'_l - \mathbf{r}'_{Im}) (z'_{IIl} + j_l \rho_{lx} - z'_{IIm} - j_m \rho_{mx}) - \mathbf{t}_{(1)}^T (\mathbf{r}'_l - \mathbf{r}'_{Im}) \left( \frac{\partial j_l}{\partial q_s} \rho_{lx} - \frac{\partial j_m}{\partial q_s} \rho_{mx} \right) \end{aligned} \quad (\text{J-65})$$

and

$$\dot{e}_{15} = \frac{d}{dt} \left( \frac{\partial \mathbf{b}_{(1)}^T}{\partial q_s} \right) \mathbf{r} + \frac{\partial \mathbf{b}_{(1)}^T}{\partial q_s} \dot{\mathbf{r}} + \dot{\mathbf{b}}_{(1)}^T \frac{\partial \mathbf{r}}{\partial q_s} + \frac{d}{dt} \left( \frac{\partial \mathbf{t}_{(1)}^T}{\partial q_s} \right) \mathbf{r}'_l - \frac{d}{dt} \left( \frac{\partial j_l}{\partial q_s} \right) \rho_{lx} \quad (\text{J-66})$$

$$\dot{e}_{25} = \frac{d}{dt} \left( \frac{\partial \mathbf{b}_{(3)}^T}{\partial q_s} \right) \mathbf{r} + \frac{\partial \mathbf{b}_{(3)}^T}{\partial q_s} \dot{\mathbf{r}} + \dot{\mathbf{b}}_{(3)}^T \frac{\partial \mathbf{r}}{\partial q_s} + \frac{d}{dt} \left( \frac{\partial \mathbf{t}_{(3)}^T}{\partial q_s} \right) \mathbf{r}'_l - \frac{d}{dt} \left( \frac{\partial j_l}{\partial q_s} \right) \rho_{lx} \quad (\text{J-67})$$

$$\begin{aligned} \dot{e}_{35} = & \frac{d}{dt} \left[ \frac{\partial \mathbf{t}_{(3)}^T}{\partial q_s} \right] (\mathbf{r}'_l - \mathbf{r}'_{Im}) (\mathbf{x}'_{IIl} + j_l \rho_{lx} - x'_{IIm} - j_m \rho_{mx}) + \frac{\partial \mathbf{t}_{(3)}^T}{\partial q_s} (\mathbf{r}'_l - \mathbf{r}'_{Im}) (j_l \rho_{lx} - j_m \rho_{mx}) \\ & + \dot{\mathbf{t}}_{(3)}^T (\mathbf{r}'_l - \mathbf{r}'_{Im}) \left( \frac{\partial j_l}{\partial q_s} \rho_{lx} - \frac{\partial j_m}{\partial q_s} \rho_{mx} \right) + \mathbf{t}_{(3)}^T (\mathbf{r}'_l - \mathbf{r}'_{Im}) \left[ \frac{d}{dt} \left( \frac{\partial j_l}{\partial q_s} \right) \rho_{lx} - \frac{d}{dt} \left( \frac{\partial j_m}{\partial q_s} \right) \rho_{mx} \right] \\ & - \frac{d}{dt} \left( \frac{\partial \mathbf{t}_{(1)}^T}{\partial q_s} \right) (\mathbf{r}'_l - \mathbf{r}'_{Im}) (z'_{IIl} + j_l \rho_{lx} - z'_{IIm} - j_m \rho_{mx}) - \frac{\partial \mathbf{t}_{(1)}^T}{\partial q_s} (\mathbf{r}'_l - \mathbf{r}'_{Im}) (j_l \rho_{lx} - j_m \rho_{mx}) \\ & - \dot{\mathbf{t}}_{(1)}^T (\mathbf{r}'_l - \mathbf{r}'_{Im}) \left( \frac{\partial j_l}{\partial q_s} \rho_{lx} - \frac{\partial j_m}{\partial q_s} \rho_{mx} \right) - \mathbf{t}_{(1)}^T (\mathbf{r}'_l - \mathbf{r}'_{Im}) \left[ \frac{d}{dt} \left( \frac{\partial j_l}{\partial q_s} \right) \rho_{lx} - \frac{d}{dt} \left( \frac{\partial j_m}{\partial q_s} \right) \rho_{mx} \right] \end{aligned} \quad (\text{J-68})$$

The constrained equations of motion are

$$[\mathbf{F}] \begin{bmatrix} \ddot{\mathbf{q}} \\ \lambda \end{bmatrix} = \begin{bmatrix} \mathcal{Q}' \\ \mathbf{r} \end{bmatrix} \quad (\text{J-69})$$

where

$$\begin{bmatrix} \ddot{\mathbf{q}} \\ \lambda \end{bmatrix} = \begin{bmatrix} \ddot{x}_I \\ \ddot{y}_I \\ \ddot{z}_I \\ \ddot{\theta}_I \\ \ddot{\phi}_I \\ \ddot{\psi}_I \\ \ddot{x}_{II} \\ \ddot{y}_{II} \\ \ddot{z}_{II} \\ \ddot{\theta}_{II} \\ \ddot{\phi}_{II} \\ \ddot{\psi}_{II} \\ \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix} \quad \begin{bmatrix} \mathcal{Q}' \\ \mathbf{r} \end{bmatrix} = \begin{bmatrix} \mathcal{Q}'_{xI} \\ \mathcal{Q}'_{yI} \\ \mathcal{Q}'_{zI} \\ \rho'_{1I} \\ \rho'_{2I} \\ \rho'_{3I} \\ \mathcal{Q}'_{xII} \\ \mathcal{Q}'_{yII} \\ \mathcal{Q}'_{zII} \\ \rho'_{1II} \\ \rho'_{2II} \\ \rho'_{3II} \\ \mathbf{r}_1 \\ \mathbf{r}_2 \\ \mathbf{r}_3 \end{bmatrix} \quad (\text{J-70})$$

$$[\mathbf{F}] = \begin{bmatrix} m_I & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & e_{1xI} & e_{2xI} & e_{3xI} \\ 0 & m_I & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & e_{1yI} & e_{2yI} & e_{3yI} \\ 0 & 0 & m_I & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & e_{1zI} & e_{2zI} & e_{3zI} \\ 0 & 0 & 0 & m_{11I} & m_{12I} & m_{13I} & 0 & 0 & 0 & 0 & 0 & e_{1\theta I} & e_{2\theta I} & e_{3\theta I} \\ 0 & 0 & 0 & m_{21I} & m_{22I} & m_{23I} & 0 & 0 & 0 & 0 & 0 & e_{1\phi I} & e_{2\phi I} & e_{3\phi I} \\ 0 & 0 & 0 & m_{31I} & m_{32I} & m_{33I} & 0 & 0 & 0 & 0 & 0 & e_{1\psi I} & e_{2\psi I} & e_{3\psi I} \\ 0 & 0 & 0 & 0 & 0 & 0 & m_{II} & 0 & 0 & 0 & 0 & e_{1xII} & e_{2xII} & e_{3xII} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{II} & 0 & 0 & 0 & e_{1yII} & e_{2yII} & e_{3yII} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{II} & 0 & 0 & e_{1zII} & e_{2zII} & e_{3zII} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{11II} & m_{12II} & m_{13II} & e_{1\theta II} & e_{2\theta II} & e_{3\theta II} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{21II} & m_{22II} & m_{23II} & e_{1\phi II} & e_{2\phi II} & e_{3\phi II} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & m_{31II} & m_{32II} & m_{33II} & e_{1\psi II} & e_{2\psi II} & e_{3\psi II} \\ e_{1xI} & e_{1yI} & e_{1zI} & e_{1\theta I} & e_{1\phi I} & e_{1\psi I} & e_{1xII} & e_{1yII} & e_{1zII} & e_{1\theta II} & e_{1\phi II} & e_{1\psi II} & 0 & 0 & 0 \\ e_{2xI} & e_{2yI} & e_{2zI} & e_{2\theta I} & e_{2\phi I} & e_{2\psi I} & e_{2xII} & e_{2yII} & e_{2zII} & e_{2\theta II} & e_{2\phi II} & e_{2\psi II} & 0 & 0 & 0 \\ e_{3xI} & e_{3yI} & e_{3zI} & e_{3\theta I} & e_{3\phi I} & e_{3\psi I} & e_{3xII} & e_{3yII} & e_{3zII} & e_{3\theta II} & e_{3\phi II} & e_{3\psi II} & 0 & 0 & 0 \end{bmatrix} \quad (J-71)$$

## APPENDIX K

### Distance in the $x_{II}'z_{II}'$ Plane Between the Initial Point of Contact on Body I of a Spring Hard-Mounted on Body II and the Tip of the Spring

The distance between the initial and current contact point for a hard-mounted spring tip is required to determine the no-slipage constraint condition.

#### A. Symbols

- $\mathbf{d}_i$  vector distance between point  $i$  on body I and point  $i$  on body II
- $\mathbf{g}$  vector distance (as defined in the title of this Appendix)  $\mathbf{g} = g_x \mathbf{e}_{IIx'} + g_z \mathbf{e}_{IIZ'}$
- $j_i$  length of extension of spring  $i$  (see Appendix B)
- $l$  subscript identifying first hard-mounted spring
- $\bar{\mathbf{r}}_{IIi}$  location in inertial space of tip of spring  $i$
- $\bar{\mathbf{r}}_{IIi}$  location in body II CS of the tip of spring  $i$
- $\mathbf{T}$  matrix product  $\mathbf{A}_{II} \mathbf{A}_i^{-1}$
- $t_{ij}$  elements of  $\mathbf{T}$  matrix ( $i^{th}$  row,  $j^{th}$  column)

#### B. Determination of $\mathbf{g}_i$

The vector  $\mathbf{g}$  consists of just the  $x$  and  $z$  components of  $\mathbf{g}_i$  in the body II CS. Now

$$\mathbf{A}_{II} \mathbf{d}_i = \mathbf{A}_{II} \mathbf{r} + \mathbf{A}_{II} \mathbf{A}_i^T \bar{\mathbf{r}}_{IIi} - \mathbf{A}_{II} \mathbf{A}_{II}^T \bar{\mathbf{r}}_{IIi} = \mathbf{A}_{II} \mathbf{r} + \mathbf{T} \bar{\mathbf{r}}_{IIi} - \bar{\mathbf{r}}_{IIi} \quad (K-1)$$

Therefore

$$g_x = \mathbf{b}_{(1)}^T \mathbf{r} + \mathbf{t}_{(1)}^T \bar{\mathbf{r}}_{IIi} - \bar{x}_{IIi}, \quad g_z = \mathbf{b}_{(3)}^T \mathbf{r} + \mathbf{t}_{(3)}^T \bar{\mathbf{r}}_{IIi} - \bar{z}_{IIi} \quad (K-2)$$

where the first spring has been specified.

Clearly

$$\bar{x}_{\text{II}} = x'_{\text{II}} + j_l \rho_{lx} \quad (\text{K-3})$$

$$\bar{z}_{\text{II}} = z'_{\text{II}} + j_l \rho_{lz} \quad (\text{K-4})$$

## APPENDIX L

### Angle of Rotation in the $x'_{\text{II}} z'_{\text{II}}$ Plane Between Body I Pads and Body II Spring Tips

The angle of rotation in the  $x'_{\text{II}} z'_{\text{II}}$  plane is required to specify the constraint condition that no such rotation shall occur.

#### A. Symbols

- a** a vector on body I from the initial point of contact of spring tip  $l$  to the initial point of contact of spring tip  $m$
- b** a vector joining the tip of spring  $l$  to the tip of spring  $m$
- e<sub>a</sub>** unit vector along the projection of **a** on the  $x'_{\text{II}} z'_{\text{II}}$  plane
- e<sub>b</sub>** unit vector along the projection of **b** on the  $x'_{\text{II}} z'_{\text{II}}$  plane
- h** angle of rotation in the  $x'_{\text{II}} z'_{\text{II}}$  plane between body I pads and body II spring tips
- $l, m$  subscripts identifying the first two hard-mounted springs
- p<sub>i</sub>** location vector of tip of spring  $i$  (see Appendix B)
- T** matrix product  $\mathbf{A}_{\text{II}} \mathbf{A}_I^{-1}$  (see Appendix K)
- $t_{ij}$  elements of the **T** matrix ( $i^{\text{th}}$  row,  $j^{\text{th}}$  column)

#### B. Calculation of **h**

During any one integration interval, if the rotation is constrained, the rotation will be small, so it is not necessary to consider angles other than those in the first and fourth quadrants.

Expression of the definitions of **a** and **b** yields Eqs. (L-1) and (L-2).

$$\mathbf{a} = \mathbf{r}'_{\text{II}} - \mathbf{r}'_{\text{Im}} \quad (\text{L-1})$$

$$\mathbf{b} = \mathbf{p}_l - \mathbf{p}_m \quad (\text{L-2})$$

Expressed in body II coordinates, Eqs. (L-1) and (L-2) become

$$\begin{aligned} \mathbf{a} &= \mathbf{A}_{\text{II}} \mathbf{A}_I^{-1} [(x'_{\text{II}} - x'_{\text{Im}}) \mathbf{e}_{\text{Ix}'} + (y'_{\text{II}} - y'_{\text{Im}}) \mathbf{e}_{\text{Iy}'} + (z'_{\text{II}} - z'_{\text{Im}}) \mathbf{e}_{\text{Ix}''}] \\ &= [t_{11}(x'_{\text{II}} - x'_{\text{Im}}) + t_{12}(y'_{\text{II}} - y'_{\text{Im}}) + t_{13}(z'_{\text{II}} - z'_{\text{Im}})] \mathbf{e}_{\text{IIx}'} \\ &\quad + [t_{21}(x'_{\text{II}} - x'_{\text{Im}}) + t_{22}(y'_{\text{II}} - y'_{\text{Im}}) + t_{23}(z'_{\text{II}} - z'_{\text{Im}})] \mathbf{e}_{\text{IIy}'} \\ &\quad + [t_{31}(x'_{\text{II}} - x'_{\text{Im}}) + t_{32}(y'_{\text{II}} - y'_{\text{Im}}) + t_{33}(z'_{\text{II}} - z'_{\text{Im}})] \mathbf{e}_{\text{IIz}'} \end{aligned} \quad (\text{L-3})$$

$$\begin{aligned}\mathbf{b} = & (x'_{IIl} - x'_{IIm} + j_l \rho_{lx} - j_m \rho_{mx}) \mathbf{e}_{IIx'} \\ & + (y'_{IIl} - y'_{IIm} + j_l \rho_{ly} - j_m \rho_{my}) \mathbf{e}_{IIf'} \\ & + (z'_{IIl} - z'_{IIm} + j_l \rho_{lz} - j_m \rho_{mz}) \mathbf{e}_{IIz'}.\end{aligned}\quad (\text{L-4})$$

Let

$$\begin{aligned}\Delta_a = & (a_{IIx'}^2 + a_{IIz'}^2)^{1/2} \\ = & \{[t_{11}(x'_{IIl} - x'_{IIm}) + t_{12}(y'_{IIl} - y'_{IIm}) + t_{13}(z'_{IIl} - z'_{IIm})]^2 \\ & + [t_{31}(x'_{IIl} - x'_{IIm}) + t_{32}(y'_{IIl} - y'_{IIm}) + t_{33}(z'_{IIl} - z'_{IIm})]^2\}^{1/2}\end{aligned}\quad (\text{L-5})$$

$$\begin{aligned}\Delta_b = & (b_{IIx'}^2 + b_{IIz'}^2)^{1/2} \\ = & [(x'_{IIl} - x'_{IIm} + j_l \rho_{lx} - j_m \rho_{mx})^2 + (z'_{IIl} - z'_{IIm} + j_l \rho_{lz} - j_m \rho_{mz})^2]^{1/2}\end{aligned}\quad (\text{L-6})$$

Then

$$\begin{aligned}\mathbf{e}_a = & \left(\frac{a_{IIx'}}{\Delta_a}\right) \mathbf{e}_{IIx'} + \left(\frac{a_{IIz'}}{\Delta_a}\right) \mathbf{e}_{IIz'} = e_{ax} \mathbf{e}_{IIx'} + e_{az} \mathbf{e}_{IIz'} \\ \mathbf{e}_b = & \left(\frac{b_{IIx'}}{\Delta_b}\right) \mathbf{e}_{IIx'} + \left(\frac{b_{IIz'}}{\Delta_b}\right) \mathbf{e}_{IIz'} = e_{bx} \mathbf{e}_{IIx'} + e_{bz} \mathbf{e}_{IIz'}.\end{aligned}\quad (\text{L-7})$$

and

$$\begin{aligned}e_{ax} = & \frac{[t_{11}(x'_{IIl} - x'_{IIm}) + t_{12}(y'_{IIl} - y'_{IIm}) + t_{13}(z'_{IIl} - z'_{IIm})]}{\Delta_a} \\ e_{az} = & \frac{[t_{11}(x'_{IIl} - x'_{IIm}) + t_{32}(y'_{IIl} - y'_{IIm}) + t_{33}(z'_{IIl} - z'_{IIm})]}{\Delta_a}\end{aligned}\quad (\text{L-8})$$

$$e_{bx} = \frac{x'_{IIl} - x'_{IIm} + j_l \rho_{lx} - j_m \rho_{mx}}{\Delta_b}\quad (\text{L-9})$$

$$e_{bz} = \frac{z'_{IIl} - z'_{IIm} + j_l \rho_{lz} - j_m \rho_{mz}}{\Delta_b}\quad (\text{L-10})$$

Since  $\mathbf{e}_a$  and  $\mathbf{e}_b$  are unit vectors

$$\sin h = |\mathbf{e}_a \times \mathbf{e}_b| = e_{az} e_{bx} - e_{ax} e_{bz}\quad (\text{L-11})$$

$$\cos h = \mathbf{e}_a \cdot \mathbf{e}_b = e_{ax} e_{bx} + e_{az} e_{bz}\quad (\text{L-12})$$

Thus

$$h = \tan^{-1} \left( \frac{e_{az} e_{bx} - e_{ax} e_{bz}}{e_{ax} e_{bx} + e_{az} e_{bz}} \right)\quad (\text{L-13})$$

## APPENDIX M

### FMARK Integration Method

The integration method used by FMARK is the fourth order Adams-Moulton predictor formula with one correction. Automatic error control is exercised by comparing the value of the predicted with the corrected result. Fourth order Runge-Kutta integration is used to build backward differences, initially or for a restart.

The classical fourth order Runge-Kutta equations follow. Let the differential equations to be solved be of the form

$$\dot{y}_j = f_j(t, \bar{y}) \quad j = 1, n \quad (\text{M-1})$$

where symbolically

$$\bar{y} = (y_1, \dots, y_n) \quad (\text{M-2})$$

Let

$$\begin{aligned} y_{j,\eta} &\quad \text{and} \quad f_{j,\eta} \quad \text{denote} \\ y_j &\quad \text{and} \quad f_j \quad \text{at} \quad t = t_\eta \end{aligned} \quad (\text{M-3})$$

Thus

$$\bar{y}_\eta = (y_{1,\eta}, \dots, y_{n,\eta}) \quad (\text{M-4})$$

Let

$$\bar{K}_i = (K_{1i}, \dots, K_{ni}) \quad (\text{M-5})$$

and

$$K_{j1} = h f_j(t, \bar{y}_\eta) \quad (\text{M-6})$$

$$K_{j2} = h f_j \left( t + \frac{h}{2}, \bar{y}_\eta + \frac{\bar{K}_2}{2} \right) \quad (\text{M-7})$$

$$K_{j3} = h f_j \left( t + \frac{h}{2}, \bar{y}_\eta + \frac{\bar{K}_2}{2} \right) \quad (\text{M-8})$$

$$K_{j4} = h f_j(t + h, \bar{y}_\eta + \bar{K}_3) \quad (\text{M-9})$$

The numerical integration equation is then

$$\bar{y}_{\eta+1} = \bar{y}_\eta + \frac{1}{6} (\bar{K}_1 + 2\bar{K}_2 + 2\bar{K}_3 + K_4) \quad (\text{M-10})$$

where  $y_{j,\eta+1}$  denotes  $y_j$  at  $t + h$ .

The Adams-Moulton fourth order predictor-corrector equations follow, where  $\bar{y}_{\eta+1}^p$  = the predicted values, and  $\bar{y}_{\eta+1}^c$  = the corrected value

$$\bar{y}_{\eta+1}^p = \bar{y}_\eta + h \left( \sum_{i=0}^4 a_i \nabla^i \right) \dot{\bar{y}}_\eta \quad (\text{M-11})$$

where

$$\begin{aligned}\nabla^0 \dot{\bar{y}}_\eta &= \dot{\bar{y}}_\eta \\ \nabla^1 \dot{\bar{y}}_\eta &= \dot{\bar{y}}_\eta - \dot{\bar{y}}_{\eta-1} \\ \nabla^2 \dot{\bar{y}}_\eta &= \nabla^1 \dot{\bar{y}}_\eta - \nabla^1 \dot{\bar{y}}_{\eta-1} \\ &\text{etc.}\end{aligned}\tag{M-12}$$

and

$$a_0 = 1, \quad a_1 = \frac{1}{2}, \quad a_2 = \frac{5}{12}, \quad a_3 = \frac{3}{8}, \quad a_4 = \frac{251}{720}\tag{M-13}$$

Also

$$\dot{\bar{y}}_{j,\eta+1}^p = f_j(t_{\eta+1}, \bar{y}_{\eta+1})\tag{M-14}$$

and the correction becomes

$$\dot{\bar{y}}_{j,\eta+1}^c = \dot{\bar{y}}_{j,\eta} + h \left( \sum_{i=0}^4 b_i \nabla^i \right) \dot{\bar{y}}_{\eta+1}^p\tag{M-15}$$

where

$$b_0 = a_0, \quad b_{m+1} = a_{m+1} - a_m, \quad m = 1, 2, 3\tag{M-16}$$

Let

$$E_{\eta+1} = \max_j \frac{|y_{j,\eta+1}^p - y_{j,\eta+1}^c|}{D_j}\tag{M-17}$$

where

$$D_j = \max |y_{j,\eta+1}^c, \hat{y}| \tag{M-18}$$

$E_{\eta+1}$  represents the maximum error in any of the dependent variables due to truncation error in the step  $t_\eta$  to  $t_{\eta+1}$ . The user, through the array HB, provides the

- $\bar{E}$  upper bound on  $E_{\eta+1}$
- $\hat{E}$  lower bound on  $E_{\eta+1}$
- $h_{\max}$  maximum allowable step size
- $h_{\min}$  minimum allowable step size
- $\hat{y}$  constant used to prevent unnecessary reduction in  $h$  whenever  $|y_{j,\eta+1}|$  is small

If  $E_{\eta+1} \leq \hat{E}$  for four successive steps,  $h$  is doubled. If  $\hat{E} < E_{\eta+1} \leq \bar{E}$ ,  $h$  is unchanged. If  $E_{\eta+1} > \bar{E}$ ,  $h$  is halved.

If a discontinuity occurs in some  $\dot{y}_j$ , it is obvious that the Adams-Moulton technique with the backward differences can not be continued. In this case, a restart must be made (i.e., Runge-Kutta integration is used for four steps). With these points, Adams-Moulton integration is continued.

### **ACKNOWLEDGMENT**

The authors would like to express their appreciation to Wilson N. Silsby who programmed much of the analysis and was a major contributor to the sections of this report describing the computer program. Grateful acknowledgment is made to Harold L. Gier, formerly of JPL, for his technical support. Additional acknowledgment is made to William A. Crisci for his services as editor of the entire report.
